Nationalism, in China as much as elsewhere, is today adopted, filtered, transformed, enhanced, and accelerated through digital networks. And as we have increasingly seen, nationalism in digital spheres interacts in complicated ways with nationalism "on the ground". If we are to understand the social and political complexities of the twenty-first century, we need to ask: what happens to nationalism when it goes digital? In China's Digital Nationalism, Florian Schneider explores the issue by looking at digital China first hand, exploring what search engines, online encyclopedias, websites, hyperlink networks, and social media can tell us about the way that different actors construct and manage a crucial topic in contemporary Chinese politics: the protracted historical relationship with neighbouring Japan. Using two cases, the infamous Nanjing Massacre of 1937 and the ongoing disputes over islands in the East China Sea, Schneider shows how various stakeholders in China construct networks and deploy power to shape nationalism for their own ends. These dynamics provide crucial lessons on how nation states adapt to the shifting terrain of the digital age and highlight how digital nationalism is today an emergent property of complex communication networks.

This work contributes to the research in the linguistic analysis of Old English with corpus-based lexical databases. In the specific area of Old English, which presents numerous morphological variations and lacks a written standard, a lemmatised corpus is necessary. Thus, the aim of this work is to lemmatise part of the verbal lexicon of Old English, combining aspects of Morphology, Lexicography and Corpus Analysis. The scope is restricted to the most morphologically complex verbal classes of Old English, including irregular verbs and reduplicative verbs, which comprise preterite-present, anomalous, contracted and strong VII verbs. This aim requires, firstly, the selection and management of the sources of data and verification of results; and secondly, the design and sequencing of the steps of the lemmatisation tasks. This research also raises the issue of the automatization of the process of lemmatisation of Old English verbs, on which little previous literature has been found. In conclusion, this work offers an inventory of inflectional forms and lemmas of the verbs under analysis. On the applied side, this work presents different procedures of automatic and manual lemmatisation that can be applied to the fields of Lexicography and Corpus Linguistics.

The fundamental mathematical tools needed to understand machine learning include linear algebra, analytic geometry, matrix decompositions, vector calculus, optimization, probability and statistics. These topics are traditionally taught in disparate courses, making it hard for data science or computer science students, or professionals, to efficiently learn the mathematics. This self-contained textbook bridges the gap between mathematical and machine learning texts, introducing the mathematical concepts with a minimum of prerequisites. It uses these concepts to derive four central machine learning methods: linear regression, principal component analysis, Gaussian mixture models and support vector machines. For students and others with a mathematical background, these derivations provide a starting point to machine learning texts. For those learning the mathematics for the first time, the methods help build intuition and practical experience with applying mathematical concepts. Every chapter includes worked examples and exercises to test understanding. Programming tutorials are offered on the book's web site.
