The core use of language is in face-to-face conversation. This is characterized by rapid turn-taking. This turn-taking poses a number central puzzles for the psychology of language. Consider, for example, that in large corpora the gap between turns is on the order of 100 to 300 ms, but the latencies involved in language production require minimally between 600 ms (for a single word) or 1500 ms (for as simple sentence). This implies that participants in conversation are predicting the ends of the incoming turn and preparing in advance. But how is this done? What aspects of this prediction are done when? What happens when the prediction is wrong? What stops participants coming in too early? If the system is running on prediction, why is there consistently a mode of 100 to 300 ms in response time? The timing puzzle raises further puzzles: it seems that comprehension must run parallel with the preparation for production, but it has been presumed that there are strict cognitive limitations on more than one central process running at a time. How is this bottleneck overcome? Far from being 'easy' as some psychologists have suggested, conversation may be one of the most demanding cognitive tasks in our everyday lives. Further questions naturally arise: how do children learn to master this demanding task, and what is the developmental trajectory in this domain? Research shows that aspects of turn-taking, such as its timing, are remarkably stable across languages and cultures, but the word order of languages varies enormously. How then does prediction of the incoming turn work when the verb (often the informational nugget in a clause) is at the end? Conversely, how can production work fast enough in languages that have the verb at the beginning, thereby requiring early planning of the whole clause? What happens when one changes modality, as in sign languages – with the loss of channel constraints is turn-taking much freer? And what about face-to-face communication amongst hearing individuals – do gestures, gaze, and other body behaviors facilitate turn-taking? One can also ask the phylogenetic question: how did such a system evolve? There seem to be parallels (analogies) in duetting bird species, and in a variety of monkey species, but there is little evidence of anything like this among the great apes. All this constitutes a neglected set of problems at the heart of the psychology of language and of the language sciences. This Research Topic contributes to advancing our understanding of these problems by summarizing recent work from psycholinguists, developmental psychologists, students of dialog and conversation analysis, linguists, phoneticians, and comparative ethologists.

Combining rigour and flexibility, MSP helps all organisations - public sector and private, large and small - achieve successful outcomes from their programme management time and time again. With change a pressing reality for all organisations, successful programme management has never been more vital to success. Organisations must respond as new processes or services are introduced, supplier relationships alter and structures adapt to market forces or legislation. At the same time, all organisations strive to achieve excellence by improving practices, offering better services, preparing more effectively for the future and encouraging innovation. But change always creates new challenges and risks. Inevitably there will be interdependencies to manage and conflicting priorities to resolve as the organisation adapts not just to a new situation internally but to the constantly shifting world outside. To enable organisations to manage their programmes successfully, they need a structured framework that does two things. It must acknowledge that every programme exists in its own context and demands unique interpretation. At the same time it must be universally applicable. MSP has been developed with these two priorities in mind. Its framework allows users to consistently manage a huge variety of programmes so that they deliver quality outcomes and lasting benefits. Fusing leadership with management best practice, MSP enables organisations to coordinate their key functions, develop a clear sense of unity and purpose and achieve the strategic cohesion necessary to drive through effective change

Governments fail to provide the public goods needed for development when its leaders knowingly and deliberately ignore sound technical advice or are unable to follow it, despite the best of intentions, because of political constraints. This report focuses on two forces—citizen engagement and transparency—that hold the key to solving government failures by shaping how political markets function. Citizens are not only queuing at voting booths, but are also taking to the streets and using diverse media to pressure, sanction and select the leaders who wield power within government, including by entering as contenders for leadership. This political engagement can function in highly nuanced ways within the same formal institutional context and across the political spectrum, from autocracies to democracies. Unhealthy political engagement, when leaders are selected and sanctioned on the basis of their provision of private benefits rather than public goods, gives rise to government failures. The solutions to these failures lie in fostering healthy political engagement within any institutional context, and not in circumventing or suppressing it. Transparency, which is citizen access to publicly available information about the actions of those in government, and the consequences of these actions, can play a crucial role by nourishing political engagement.

An illustrated account of the crucial part played by tanks—and other armored vehicles—in gaining a foothold after the D-Day landings. Tanks were the beasts of the Second World War, machines designed to destroy anything and anyone in their path. Throughout the summer of 1944, the Allied forces readily employed tanks and armored vehicles to gain ground in the bloody campaign of Normandy. Heavily armed, they provided a kind of support which no number of infantrymen could offer, battling their way through enemy lines with their guns blazing. From the US 2nd Armored Division named “Hell on Wheels” to the British “Achilles” tank, the encounters they had in battle were explosive. With detailed diagrams and many photos, this volume of the Casemate Illustrated series explores the Normandy invasion from the perspective of the Allied Armored divisions, looking at how armored vehicles played a central role in the many battles that took place. It includes over forty profiles of tanks and armored vehicles, from the American Sherman and Stuart tanks to the bulldozers and amphibious vehicles designed for the beach.

Freedom of expression, long an issue that united liberals, now serves to drive them apart. Many feminists demand the banning of pornography; representatives of ethnic groups campaign for curbs on hate speech; liberal reformers work to restrict the funding of political campaigns and to regulate the press. Focusing on such issues, this book examines the collision of the traditional liberal ideals of equality and freedom with modern social structures, and speculates on what role the State might play in furthering public debate. The author analyzes the pressure on liberal thought resulting from such controversies as pornography, Mapplethorpe and artistic expression, the rights of street-corner orators, and the rise of the communications media.
