AFTER ten years' preparation the first edition of our Atlas of Human Anatomy was published between 1946 and 1951. Our experience enabled us to improve each of the subsequent editions and the present one has also been thoroughly revised and enlarged to allow the inclusion of more instructive illustrations. Throughout we have adhered to our original intention that this work should be a well proportioned Atlas of life-like illustrations primarily for medical students but also useful to the practising

physician and surgeon. The introduction of topographical illustrations in the third volume has been welcomed by readers and, while not embarking on histology, semi-microscopic figures have been introduced into some chapters for a better understanding of function. We did not deviate without reason from the currently accepted methods of illustrating the elements of the different systems such as bones, joints, muscles, vessels and nerves and we were at pains to base our illustrations on original dissections and to include in them only essential details. The use of colour in the illustrations, introduced by the Italian anatomist Aselli (1627), was with didactic intent. The legends to the illustrations of this edition use the nomenclature of the "Nomina Anatomica", Paris 1955 (PNA) , as revised in New York in 1960.

This Color Atlas of Anatomy features full-color photographs of actual cadaver dissections, with accompanying schematic drawings and diagnostic images. The photographs depict anatomic structures with a realism unmatched by illustrations in traditional atlases and show students specimens as they will appear in the dissection lab. Chapters are organized by region in order of standard dissection, with structures presented both in a systemic manner, from deep to surface, and in a regional manner. This edition has additional clinical imaging, including MRIs, CTs, and endoscopic techniques. New graphics include clinically relevant nerve and vessel varieties and antagonistic muscle functions. Many older images have been replaced with new, high-resolution images. Black-and-white dissection photographs have been replaced with color photography. A companion website will include an Image Bank, interactive software (similar to an Interactive Atlas), and full text online.

This unique atlas includes over 475 full color photomicrographs while providing students with a readily accessible source of morphologic information for use in the identification of tissues and organs. Each photomicrograph is accompanied by explanatory captions that guide students to the key morphologic features that identify the function of the structures. The self-assessment section at the end of the book serves as a review tool for those structures that students traditionally have difficulty in
