Many AIS textbooks do not explain the basic structure of an entire accounting information system. When students finish this textbook, they will really understand an accounting system. Some books focus more on technology topics than basic accounting system topics. Few accounting graduates will apply for jobs to build databases. Most will be users, auditors, and implementers of accounting systems and need to understand how accounting software works. As a result, this book has a practitioner emphasis, not a systems development emphasis as do many accounting textbooks. Intended to meet the needs of a first course in accounting information systems at either the undergraduate or graduate level, this textbook may also be used as a review text in second or subsequent courses in this area.

This text seeks to show the reader how to design and use an accounting information system (AIS) to provide information useful for decision-making. Focus boxes providing real world examples of concepts, techniques and practices as described are interspersed in the text. This edition has chapters on the three basic functions of the AIS together with an understanding of what the system does manually, and on data modelling, covering how students can use query language to derive traditional financial statements and managerial reports from a database AIS.
