Simon Benninga takes the reader step by step through each model, showing how it can be solved using Microsoft Excel. In this sense, this is a finance "cookbook", providing recipes with lists of ingredients and instructions. Areas covered include the computation of corporate finance problems, standard portfolio problems, option pricing and applications, and duration and immunization. The author includes a set of chapters dealing with advanced techniques, including random number generation, matrix manipulation, and the Gauss-Seidel method. Although the reader should know enough about Excel to set up a simple spreadsheet, the author explains advanced Excel techniques such as functions, macros, the use of data tables, and VBA programming. The book comes with a disk containing Excel worksheets

In the spring of 2010, the Humboldt State University formed the Geospatial Task Force to improve the geospatial curriculum. Assigned to develop a practical series of Geospatial courses that would serve students across multiple programs,

two primary areas of assessment were considered. First, the existing curriculum was evaluated for redundancy and overlap. Second, professional requirements were identified to eliminate obsolete content and replace it with relevant job skills. As a member of the Geospatial Task Force, I conducted interviews with both alumni and students to gain first-hand insight into our assessment goals. The consensus from those who had experience with geospatial courses at HSU was that the Intermediate Geographic Information Systems course was outdated and lacked relevancy in terms of job skills and modern analytical methods. This assessment was confirmed when course content was evaluated based on standards defined in the U.S. Department of Labor Geospatial Technology Competency Model. This book is the result of the work and development that followed over the years following the Geospatial Task Force recommendation. Here, readers will find an introduction to several geospatial modeling techniques. Though some tutorials presented here cover similar concepts, each represents a complete and independent exercise. The modeling techniques shown here only scratch the surface of what is possible for each. The intent is to introduce readers to a varied array of geospatial modeling techniques and to prepare students for more advanced work. I sincerely hope that by working through these tutorials, you will develop the skills you need to be successful in the workplace. —Nicolas

"Fletcher and Gardner have created a comprehensive resource that will be of interest not only to those working in the field of finance, but also to those using numerical methods in other fields such as engineering, physics, and actuarial mathematics. By showing how to combine the high-level elegance, accessibility, and flexibility of Python, with the low-level computational efficiency of C++, in the context of interesting financial modeling problems, they have provided an implementation template which will be useful to others seeking to jointly optimize the use of computational and human resources. They document all the necessary technical details required in order to make external numerical libraries available from within Python, and they contribute a useful library of their own, which will significantly reduce the start-up costs involved in building financial models. This book is a must read for all those with a need to apply numerical methods in the valuation of financial claims." –David Louton, Professor of Finance, Bryant University This book is directed at both industry practitioners and students interested in designing a pricing and risk management framework for financial derivatives using the Python programming language. It is a practical book complete with working, tested code that guides the reader through the process of building a

flexible, extensible pricing framework in Python. The pricing frameworks' loosely coupled fundamental components have been designed to facilitate the quick development of new models. Concrete applications to real-world pricing problems are also provided. Topics are introduced gradually, each building on the last. They include basic mathematical algorithms, common algorithms from numerical analysis, trade, market and event data model representations, lattice and simulation based pricing, and model development. The mathematics presented is kept simple and to the point. The book also provides a host of information on practical technical topics such as C++/Python hybrid development (embedding and extending) and techniques for integrating Python based programs with Microsoft Excel.

Create an inventory system! Calculate loan repayments! Handle a production's limiting factors successfully! Work out customers' profitability! Yes, most of the above and much more can be achieved in Microsoft Excel if you understand some basic concepts of financial modelling and analysis. This book was written to help any users wanting to have a clear understanding of how Excel can help to perform some aspects of financial modelling and analysis using some of its built-in financial and logical functions. It goes further by elaborating detail exercises on the above. The book introduces the basic concepts of balance sheet, income statement and cash flow and builds the relevant models. Many books have been written on Excel. However, this book explains some advanced techniques for sensitivity analysis and features in a rather simplified manner
