Excerpt from The Principles of Anatomy and Physiology Applied to the Preservation of Health This enamel is thickest on the grinding surface, and on the cutting edges or point of the tooth, becoming gradually thinner as it approaches the neck, where it terminates insensibly. Each tooth has an inner cavity, which, beginning by a small Opening at the point of the fang, becomes larger, and terminates in the body of the tooth. The cavity is supplied with blood - vessels and nerves, which pass through the small hole in the root. In old people this hole commonly closes, and the sensibility of the tooth is destroyed.
