There has been much polemic about affluence, consumption, and the global environment. For some observers, "consumption" is at the root of global environmental threats: wealthy individuals and societies use far too much of the earth's resource base and should scale back their appetites to preserve the environment for future generations and allow a decent life for the rest of the world. Other observers see affluence as the way to escape environmental threats: economic development increases public pressure for environmental protection and makes capital available for environmentally benign technologies. The arguments are fed by conflicting beliefs, values, hopes, and fears--but surprisingly little scientific analysis. This book demonstrates that the relationship of consumption to the environment needs careful analysis by environmental and social scientists and conveys some of the excitement of treating the issue scientifically. It poses the key empirical questions: Which kinds of consumption are environmentally significant? Which actors are responsible for that consumption? What forces cause or explain environmentally significant consumption? How can it be changed? The book presents studies that open up important issues for empirical study: Are there any signs of saturation in the demand for travel in wealthy countries? What is the relationship between environmental consumption and human well-being? To what extent do people in developing countries emulate American consumption styles? The book also suggests broad strategies that scientists and research sponsors can use to better inform future debates about the environment, development, and consumption.

"2 full-length practice tests with complete answer explanations"--Cover.

With an emphasis on the challenges of sustaining the commons across local to global scales, *Making Commons Dynamic* examines the empirical basis of theorising the concepts of commonisation and decommonisation as a way to understand commons as a process and offers analytical directions for policy and practice that can potentially help maintain commons as commons in the future. Focusing on commonisation–decommonisation as an analytical framework useful to examine and respond to changes in the commons, the chapter contributions explore how natural resources are commonised and decommonised through the influence of multi-level internal and external drivers, and their implications for commons governance across disparate geographical and temporal contexts. It draws from a large number of geographically diverse empirical cases – 20 countries in North, South, and Central America and South- and South-East Asia. They involve a wide range of commons – related to fisheries, forests, grazing, wetlands, coastal-marine, rivers and dams, aquaculture, wildlife, tourism, groundwater, surface freshwater, mountains, small islands, social movements, and climate. The book is a transdisciplinary endeavour with contributions by scholars from geography, history, sociology, anthropology, political studies, planning, human ecology, cultural and applied ecology, environmental and development studies, environmental science and technology, public policy, Indigenous/tribal studies, Latin American and Asian studies, and environmental change and governance, and authors representing the commons community, NGOs, and policy. Contributors include academics, community members, NGOs, practitioners, and policymakers. Therefore, commonisation–decommonisation lessons drawn from these chapters are well suited for contributing to the practice, policy, and theory of the commons, both locally and globally.

Sustainability has become a buzzword in the last decade, but its full meaning is complex, emerging from a range of different sectors. In practice, it has become the springboard for millions of individuals throughout the world who are forging the fastest and most profound social transformation of our time—the sustainability revolution. *The Sustainability Revolution* paints a picture of this largely unrecognized phenomenon from the point of view of five major sectors of society: Community (government and international institutions) Commerce (business) Resource extraction (forestry, farming, fisheries etc.) Ecological design (architecture, technology) Biosphere (conservation, biodiversity etc.) The book analyzes sustainability as defined by each of these sectors in terms of the principles, declarations and intentions that have emerged from conferences and publications, and which serve as guidelines for policy decisions and future activities. Common themes are then explored, including: An emphasis on stewardship The need for economic restructuring promoting no waste and equitable distribution An understanding and respect for the principles of nature The restoration of life forms An intergenerational perspective on solutions Concluding that these themes in turn represent a new set of values that define this paradigm shift, *The Sustainability Revolution* describes innovative sustainable projects and policies in Colombia, Brazil, India and the Netherlands and examines future trends. Complete with a useful resources list, this is the first book of its kind and will appeal to business and government policymakers, academics and all interested in sustainability.

"*Environment: The Science Behind the Stories 7e* is written for an introductory environmental science course for non-science majors. The "central case studies" hook students with stories at the beginning of a chapter and are threaded throughout. Related "Science Behind the Stories" boxes are integrated throughout to guide students through scientific discoveries, the ongoing pursuit of questions, and an understanding of the process of science. Unfolding stories about real people and places make environmental science memorable to non-science majors, and engage them in the content"--

Designed as a basic text for foundation and undergraduate courses in Environmental Studies, this book introduces students to key scientific concepts related to environment and sustainable development. It provides a comprehensive understanding of environmental concerns and issues with special reference to the Indian context. The primary objective of the book is to create an awareness of the environment. It conceptualizes the environment as a multidimensional and complex living system and describes the interlinkages that make up this system. The presentation is supported by relevant examples and case studies to contextualize the information given. Questions and self-learning exercises are provided at the end of each chapter to assist students to understand and apply the content in their immediate environment. Specifically, the book: - Highlights the interconnectedness of phenomena in real life, and the interdisciplinary and multidisciplinary nature of environmental studies. - Presents case studies to highlight examples of individual and collective action that have 'made a difference'. - Provides self-learning exercises for each chapter to help develop skills of observation, data collection, analysis, synthesis and presentation. Written in a non-technical manner and supported by attractive illustrations, this text will be welcomed not only by students but by anyone interested in understanding the environment. It is specially relevant as it is being published on the eve of the UN Decade for Education for Sustainable Development (2005–2014).
