This timely collection of essays - written by nine recognized forestry and environmental specialists - tells the story of the conservation, use, and changes in the Commonwealth's forests over time. The book traces the development of pre-settlement, colonial, and post-Revolutionary War forest practices, and concludes with recommendations as to how history might be used to inform and shape future policy. Underscored is the importance of private and local leadership, such as the unique Massachusetts town forest movement. Economic contributions and educational programs are detailed, as well as the ways Massachusetts' leadership has influenced national forestry. Written for the layperson, and reflecting the particular experience and style of each contributor, the history will appeal to a range of readers from local conservation activists to forestry professionals and policymakers.

A comprehensive guide to the care of trees, this book covers all aspects of arboriculture from the fundamentals of tree growth and development to developing plant health care programs. It discusses aspects of site selection and modification including climate, and soil and water management. The book follows the tree from selection in the nursery to planting and aftercare through such routine practices as pruning, fertilization, support systems, and plant health care. Key management situations such as tree preservation, hazard assessment, and problem diagnosis are discussed in detail. The fourth edition offers several new features that the student of arboriculture and practicing arborists will find valuable: Reorganization of topics to improve continuity of information Addition of overviews and summaries for each chapter Updated assessment of tree care practices such as soil amendments, mycorrhizae, and tree growth regulators Thorough evaluation of the benefits from trees (economic, environmental, ecological, and psychological) including examples of the most recent research on cost-benefit analysis of trees in urban areas Emphasis on special management situations such as structural soils, root-pavement conflicts, and remnant forests

Fully updated and greatly enhanced, the Third Edition of *Urban Forestry* addresses current issues in planning, establishing, and managing trees, forests, and other elements of nature in urban and community ecosystems. The authors discuss why we have trees in cities and how we use them, clarify the appraisal and inventory of urban vegetation, and extensively delve into the planning and management of public as well as private vegetation. As urban forestry continues to evolve as a profession, foresters and arborists can expect many challenges as well as opportunities. The continuing development of cities has become linked to a much greater emphasis on urban vegetation, the growing demand for recreation amenities within the urban environment, and the careful and successful management of vegetation in an urban ecosystem. New ways to incorporate the highly versatile urban forest resource into the urban fabric will undoubtedly benefit the lives of its residents.

Many arborists learn tree work practices without fully understanding the biological and physiological principles behind them. However, outcomes for the health and longevity of trees are greatly improved when an arborist understands the science behind the care of tree root systems and crowns. In *Applied Tree Biology*, Drs. Hiron and Thomas draw upon their decades of experience in the laboratory, classroom,

and the field – as well as the expertise of distinguished contributors to this volume – to provide those responsible for tree care with the scientific information that informs best practices for planting, pruning, soil decompaction, irrigation, and much more. Takes a multidisciplinary approach, integrating knowledge from plant biology, physiology, arboriculture, ecology, and more Provides a systematic presentation of fundamental tree biology and the scientific principles informing high quality tree care Presents accessible scientific information and best practices that help promote the health and longevity of trees Reflects the authors' decades of experience as tree biology researchers and educators, as well as their years of professional experience across the globe Applied Tree Biology is an indispensable source of practical, succinct information on tree biology, physiology, and ecology for professionals and interested amateurs involved with the care of trees. Arborists, foresters, and horticulturists at all stages of their careers will find this text particularly useful.

"The "Evaluating Tree Defects" field guide is an excellent resource for seeing the different types of tree defects, guidelines for evaluating those defects, and guidelines for evaluating tree decay. The field guide is often used by Arborist's to show to their customers while evaluating their trees. The field guide is 34 pages with 58 color photographs and 43 illustrations. The field guide explains how to evaluate the major categories of tree defects with eighteen easy to use field guidelines. There are several examples of each type of tree defect. Additionally, there are sections on the common defects of each species, resistance to decay by species, basic tree mechanics, terminology, and safety issues for arborists."--Pub. desc.

Creation and access to green spaces promotes individual human health, especially in therapeutic contexts among those suffering

traumatic events. But what of the role of access to green space and the act of creating and caring for such places in promoting social health and well-being? Greening in the Red Zone asserts that creation and access to green spaces confers resilience and recovery in systems disrupted by violent conflict or disaster. This edited volume provides evidence for this assertion through cases and examples. The contributors to this volume use a variety of research and policy frameworks to explore how creation and access to green spaces in extreme situations might contribute to resistance, recovery, and resilience of social-ecological systems. This book is an essential reference tool for all those who have a passion for trees as well as those who work in tree-related professions whether they be garden managers, forest and country park wardens, foresters, woodland managers or those working in the fields of arboriculture and horticulture. Moreover, this volume is also intended to be a textbook of trees aimed at arboriculture, horticulture and forestry students studying at National Diploma and Higher National Diploma levels and for candidates of the Royal Horticultural Society's Diploma in Horticulture and the Society's Master of Horticulture [RHS] Award. Other books in this field have tended to concentrate either on the science of trees, or have specialized on their management, culture or aesthetics. This volume, however, is a comprehensive study that illustrates the relationship between all these subjects. It considers the benefits of trees, their classification and nomenclature, all aspects of their biology and structure, the identifying features of trees and their use in the landscape. Covers woodlands, woodland gardens and arboreta, the management of individual trees and the harmless, helpful and harmful agencies of trees including parasites, fungi, diseases and pests. Examines the propagation systems of trees and shrubs, the environment of tree roots, and the planting, establishment and support of trees. Includes an extensive glossary of terms and concepts.
