There are an estimated 600,000,000 passenger cars in the world, and that number is increasing every day. So too is Earth's supply of parking spaces. In some cities, parking lots cover more than one-third of the metropolitan footprint. It's official: we have paved paradise and put up a parking lot. In *ReThinking a Lot*, Eran Ben-Joseph shares a different vision for parking's future. Parking lots, he writes, are ripe for transformation. After all, their design and function has not been rethought since the 1950s. With this book, Ben-Joseph pushes the parking lot into the twenty-first century. Ben-Joseph shows that parking lots can be aesthetically pleasing, environmentally and architecturally responsible, and used for something other than car storage. He introduces us to some of the many alternative and nonparking purposes that parking lots have served -- from RV campgrounds to stages for "Shakespeare in the Parking Lot." He shows us parking lots that are lushly planted with trees and flowers and beautifully integrated with the rest of the built environment. With purposeful design, Ben-Joseph argues, parking lots could be significant public places, contributing as much to their communities as great boulevards, parks, or plazas. For all the acreage they cover, parking lots have received scant attention. It's time to change that; it's time to rethink the lot.

"The contour line is the only precise and accurate means for representing the free and natural formation of terrain in the plan; so learn to use this instrument!" Professor Hans Loidl, Landscape Architect and Teacher

The two design elements of landscape architecture are plants and terrain. While the subject of vegetation is well documented by numerous publications, there is a lack of technical literature in the field of grading. This volume fills that gap: History, forms of terrain, basic principles, digital modeling, slope reinforcement systems, construction site implementation, and practical examples – all are treated in detail by the author. Short problems, systematically organized and arranged in increasing order of difficulty, enable the reader to apply what he or she has learned. The exercises are suitable for self-study. Together with the large amount of practical information provided by the book, they also enable architects to become familiar with grading as an important design element of landscape architecture.

Early to mid-twentieth-century America was the heyday of a car culture that has been called an "automobile utopia." In *American Autopia*, Gabrielle Esperdy examines how the automobile influenced architectural and urban discourse in the United States from the earliest days of the auto industry to the aftermath of the 1970s oil crisis. Paying particular attention to developments after World War II, Esperdy creates a narrative that extends from U.S. Routes 1 and 66 to the Las Vegas Strip to California freeways, with stops at gas stations, diners, main drags, shopping centers, and parking lots along the way. While it addresses the development of auto-oriented landscapes and infrastructures, *American Autopia* is not a conventional history, offering instead an exploration of the wide-ranging evolution of car-centric territories and drive-in typologies, looking at how they were scrutinized by diverse cultural observers in the middle of the twentieth century. Drawing on work published in the popular and professional press, and generously illustrated with evocative images, the book shows how figures as diverse as designer Victor Gruen, geographer Jean Gottmann, theorist Denise Scott Brown, critic J.B. Jackson, and historian Reyner Banham constructed "autopia" as a place and an idea. The result is an intellectual history and interpretive roadmap to the United States of the Automobile.
