This study scrutinizes the significance of transnational mobilization for language minorities, both with regard to their ability and their motivation to undertake such action. It is designed as interpretative case study on Romanian minorities in the post-communist countries of Serbia, Bulgaria, Ukraine, and Hungary. The book concentrates on immobile and marginal groups outside the focus of international politics and research. It contributes to recent research on cosmopolitanism: only an in-depth study of actors' everyday reality can produce qualified claims on the tense relationship between local rootedness on the one hand and possibilities for international mobility on the other. This, in turn, is vital to assess the vigor of international processes such as globalization and European integration. Using the new OpenCL (Open Computing Language) standard, you can write applications that access all available programming resources: CPUs, GPUs, and other processors such as DSPs and the Cell/B.E. processor. Already implemented by Apple, AMD, Intel, IBM, NVIDIA, and other leaders, OpenCL has outstanding potential for PCs, servers, handheld/embedded devices, high perfomance computing, and even cloud systems. This is the first comprehensive, authoritative, and practical guide to OpenCL 1.1 specifically for working developers and software architects. Written by five leading OpenCL authorities, OpenCL Programming Guide covers the entire specification. It reviews key use cases, shows how OpenCL can express a wide range of parallel algorithms, and offers complete reference material on both the API and OpenCL C programming language. Through complete case studies and downloadable code examples, the authors show how to write complex parallel programs that decompose workloads across many different devices. They also present all the essentials of OpenCL software performance optimization, including probing and adapting to hardware. Coverage includes Understanding OpenCL's architecture, concepts, terminology, goals, and rationale Programming with OpenCL C and the runtime API Using buffers, sub-buffers, images, samplers, and events

This white paper is part of a series that promotes knowledge about language technology and its potential. It addresses educators, journalists, politicians, language communities and others. The availability and use of language technology in Europe varies between languages. Consequently, the actions that are required to further support research and development of language technologies also differ for each language. The required actions depend on many factors, such as the complexity of a given language and the size of its community. META-NET, a Network of Excellence funded by the European Commission, has conducted an analysis of current language resources and technologies. This analysis focused on the 23 official European languages as well as other important national and regional languages in Europe. The results of this analysis suggest that there are many significant research gaps for each language. A more detailed expert analysis and assessment of the current situation will help maximise the impact of additional research and minimize any risks. META-NET consists of 54 research centres from 33 countries that are working with stakeholders from commercial businesses, government agencies, industry, research organisations, software companies, technology providers and European universities. Together, they are creating a common technology vision while developing a strategic research agenda that shows how language technology applications can address any research gaps by 2020.

Why should you build your own website on your own domain instead of using a free service? The answer is that, with your own privately registered domain and hosting account, YOU own and control the website, not anybody else. You can put whatever you like on your site and no-one can tell you otherwise. You can make your site look and behave

how you like. You're the boss. And, with your own website, you can build your own distinctive 'brand', whether you are a business or a community group, an individual, or whatever... Your domain becomes your own exclusive web address, your own piece of online virtual 'real estate' that plays its part in publicizing your mission or message. Creating a website on your own domain gives you identity, visibility and, indeed, status. But don't you need a professional web designer to make a good job building a website? No, definitely not! This was the case in the early days of the Internet because only a few tech-savvy geeks knew and understood the computer language (HTML) required. But as the technology has advanced, so have the tools to build websites become more accessible. WordPress is one of these tools and WordPress is the subject of this e-book. But how much does it cost to make a website? The answer is just a few bucks per month for hosting. If you create your own website using WordPress, you don't have to spend another cent. And what if you're looking to start a blog? Well, the same instructions apply. WordPress was originally designed as a blogging platform and this ebook shows you just how to build a blog using the same techniques as designing a website. Whether you want to create a simple WordPress blog or design a full-blown ecommerce site, Sarah's 'WordPress To Go' will start you off on the right foot.
