MORE THAN 80 MILLION COPIES SOLD Nominated as one of America's best-loved novels by PBS's The Great American Read While in Paris, Harvard symbologist Robert Langdon is awakened by a phone call in the dead of the night. The elderly curator of the Louvre has been murdered inside the museum, his body covered in baffling symbols. As Langdon and gifted French cryptologist Sophie Neveu sort through the bizarre riddles, they are stunned to discover a trail of clues hidden in the works of Leonardo da Vinci—clues visible for all to see and yet ingeniously disguised by the painter. Even more startling, the late curator was involved in the Priory of Sion—a secret society whose members included Sir Isaac Newton, Victor Hugo, and Da Vinci—and he guarded a breathtaking historical secret. Unless Langdon and Neveu can decipher the labyrinthine puzzle—while avoiding the faceless adversary who shadows their every move—the explosive, ancient truth will be lost forever.

In an increasingly interconnected world, data breaches grab headlines. The security of sensitive information is vital, and new requirements and regulatory bodies such as the Payment Card Industry Data Security Standard (PCI-DSS), Health Insurance Portability and Accountability Act (HIPAA), and Sarbanes-Oxley (SOX) create challenges for enterprises that use encryption to protect their information. As encryption becomes more widely adopted, organizations also must contend with an ever-growing set of encryption keys. Effective management of these keys is essential to ensure both the availability and security of the encrypted information. Centralized management of keys and certificates is necessary to perform the complex tasks that are related to key and certificate generation, renewal, and backup and recovery. The IBM® Enterprise Key Management Foundation (EKMF) is a flexible and highly secure key management system for the enterprise. It provides centralized key management on IBM zEnterprise® and distributed platforms for streamlined, efficient, and secure key and certificate management operations. This IBM Redbooks® publication introduces key concepts around a centralized key management infrastructure and depicts the proper planning, implementation, and management of such a system using the IBM Enterprise Key Management Foundation solution.

The Government's Future of Air Transport strategy aims to significantly increase UK airport capacity over the next two decades to accommodate the predicted growth in demand for air travel. New runways at Heathrow and Stansted airports are two of the key airport development proposals. If all the White Paper-supported airport development proposals came to fruition, current Government forecasts predict that the number of passengers passing through UK airports will increase from 241 million passengers a year in 2007 to 455 million passengers a year in 2030. This UK growth matches air traffic predictions for the whole continent. Eurocontrol, the European Organisation for the Safety of Air Navigation, predicts that European air traffic will double by 2020. If rising demand for air travel is to be met effectively through additional airport capacity, a corresponding increase in airspace capacity must be realised. However, a country's airspace, the portion of atmosphere above its territory and territorial waters, controlled by that country is a finite resource. UK airspace, particularly in the South East of England, is already some of the busiest and most complex to manage in the world. This will almost certainly require improvements in the efficiency of the UK air traffic management system.The Committee's inquiry aims to look at how to meet these challenges. Its findings are aimed at those organisations responsible for airspace-related decisions in the UK: the CAA, NATS, and the Department for Transport. Passenger numbers and freight demand globally have declined in 2008 and in the first months of 2009. In its conclusions and recommendations the Committee covered the management of airspace, strategy, change and co-ordination in airspace management, environmental impacts of airspace changes and European developments.

Behind and Beyond the Chicago Convention The Evolution of Aerial Sovereignty Edited by Pablo Mendes de Leon & Niall Buissing The Convention on International Civil Aviation which was concluded in Chicago on 7 December 1944, commonly referred to as the Chicago Convention, is one of the most ratified multilateral agreements currently in force, with 193 States parties. In this deeply informative book celebrating its 75th birthday, thirty-three of the most distinguished authors in aviation law offer perspectives on the quality of the Convention's achievements, which principally address the promotion of safety and security. Emphasising the Convention's flexibility in the accommodation of social and technological changes, the authors investigate such topics and issues as the following: environmental protection measures such as abatement of noise and reduction of the damaging effects of gaseous emissions; effect of new methods of communication such as Global Navigation Satellite Systems (GNSS); distinction between civil and State aircraft; economic regulation as established under air services agreements between States; cybersecurity measures; compensation for damages; liberalisation of air services; role of regional aviation organisations, in particular, that of the European Union; position of airlines, airports, and providers of air navigation services; and territorial jurisdiction with respect to areas lacking a universally accepted sovereign status. Annexes include the original texts of the Paris Convention 1919 and the Chicago Convention 1944. With its incisive perceptions put forward by distinguished aviation lawyers – including an exploration of the absolute character of sovereignty – this book is without peer in its analysis of how the Chicago Convention affects the regulation of international civil aviation and the operation of air services. Its multifaceted approach towards the current state of affairs from a legal and policy perspective will be welcomed by practitioners and law firms in the field and civil aviation authorities, as well as by academics and business persons with a stake in aviation.

There is a great deal of change happening in the technology being used for local networks. As Web intranets have driven bandwidth needs through the ceiling, inexpensive Ethernet NICs and switches have come into the market. As a result, many network professionals are interested in evaluating these new technologies for implementation consideration. If you are looking for advice from experts who can help you realistically compare and decide how to use the options before you. Often, books on this subject are too varied in subject matter, attempting to cover to many subjects in the book. This book addresses the topic of Ethernet Networking from a planning perspective to a bit analysis of the Ethernet packets. It explains in detail information in the new network administrator would find it necessary to know.

A tumour suppressor gene is a gene that reduces the probability that a cell in a multicellular organism will turn into a tumor cell. A mutation or deletion of such a gene will increase the probability of the formation of a tumor. Unlike oncogenes, tumor suppressor genes generally follow the 'two-hit hypothesis', which implies that both alleles that code for a particular gene must be affected before an effect is manifested. This is due to the fact that if only one allele for the gene is damaged, the second can still produce the correct protein. However, there are cases where mutations in only one allele will cause an effect. A notable example is the gene that codes for p53. Tumor suppressor genes, or more precisely, the proteins for which they code, either have a dampening or repressive effect on the regulation of the cell cycle or promote apoptosis, and sometimes do both. This book presents new and important research from throughout the world.

Now that there's software in everything, how can you make anything secure? Understand how to engineer dependable systems with this newly updated classic In Security Engineering: A Guide to Building Dependable Distributed Systems, Third Edition Cambridge University professor Ross Anderson updates his classic textbook and teaches readers how to design, implement, and test systems to withstand both error and attack. This book became a best-seller in 2001 and helped establish the discipline of security engineering. By the second edition in 2008, underground dark markets had let the bad guys specialize and scale up; attacks were increasingly on users rather than on technology. The book repeated its success by showing how security engineers can focus on usability. Now the third edition brings it up to date for 2020. As people now go online from phones more than laptops, most servers are in the cloud, online advertising drives the Internet and social networks have taken over much human interaction, many patterns of crime and abuse are the same, but the methods have evolved. Ross Anderson explores what security engineering means in 2020, including: How the basic elements of cryptography, protocols, and access control translate to the new world of phones, cloud services, social media and the Internet of Things Who the attackers are – from nation states and business competitors through criminal gangs to stalkers and playground bullies What they do – from phishing and carding through SIM swapping and software exploits to DDoS and fake news Security psychology, from privacy through ease-of-use to deception The economics of security and dependability – why companies build vulnerable systems and governments look the other way How dozens of industries went online – well or badly How to manage security and safety engineering in a world of agile development – from reliability engineering to DevSecOps The third edition of Security Engineering ends with a grand challenge: sustainable security. As we build ever more software and connectivity into safety-critical durable goods like cars and medical devices, how do we design systems we can maintain and defend for decades? Or

will everything in the world need monthly software upgrades, and become unsafe once they stop?
