ORPHAN, CLOCK KEEPER, AND THIEF, twelve-year-old Hugo lives in the walls of a busy Paris train station, where his survival depends on secrets and anonymity. But when his world suddenly interlocks with an eccentric girl and her grandfather, Hugo's undercover life, and his most precious secret, are put in jeopardy. A cryptic drawing, a treasured notebook, a stolen key, a mechanical man, and a hidden message from Hugo's dead father form the backbone of this intricate, tender, and spellbinding mystery.

Patterns and instructions for creating four models.

This book deals with the evolution of mechanical toys following on the history of automata from very early times.

Making Automata is hard. Making other sorts of three dimensional objects can also be hard, but the extra dimension of movement seems to add a disproportionate amount of difficulty. For most people, especially those untrained in engineering skills, getting to the point where making mechanical devices is easy, can be a long and frustrating task. Then again, there are many people who have a sound understanding of engineering but can't even draw a horse. These things can be learnt. This book does not teach you to draw a horse, but it removes the mystery that surrounds the world of mechanisms and the business of making things move. Cabaret Mechanical Movement

contains a lot of theory but it is also packed with practical tips and ideas for making your own automata, moving toys, or mechanical sculpture.

Four working models to cut out and glue together. If you like making working models, then you will be delighted with this collection. The Runabout Train follows its track through the tunnel and the Busybuzzy bees buzz about in a rather random and beelike fashion. The Hare and the Tortoise race to a very close finish, and the Owl and the Pussycat set off in their peagreen boat. All of them make use of different mechanisms and the collection is a fine display of ingenious and colourful paper engineering.

In the sixteenth and seventeenth centuries, German clockwork automata were collected, displayed, and given as gifts throughout the Holy Roman, Ottoman, and Mughal Empires. In *Animating Empire*, Jessica Keating recounts the lost history of six such objects and reveals the religious, social, and political meaning they held. The intricate gilt, silver, enameled, and bejeweled clockwork automata, almost exclusively crafted in the city of Augsburg, represented a variety of subjects in motion, from religious figures to animals. Their movements were driven by gears, wheels, and springs painstakingly assembled by clockmakers. Typically wound up and activated by someone in a position of power, these objects and the theological and political arguments they made were highly valued by German-speaking nobility. They were often given as gifts and as tribute payment, and they played remarkable roles in the Holy Roman Empire, particularly with regard to courtly notions about the important early

modern issues of universal Christian monarchy, the Reformation, the Counter-Reformation, the encroachment of the Ottoman Empire, and global trade.

Demonstrating how automata produced in the Holy Roman Empire spoke to a convergence of historical, religious, and political circumstances, *Animating Empire* is a fascinating analysis of the animation of inanimate matter in the early modern period. It will appeal especially to art historians and historians of early modern Europe. The theoretical underpinnings of computing form a standard part of almost every computer science curriculum. But the classic treatment of this material isolates it from the myriad ways in which the theory influences the design of modern hardware and software systems. The goal of this book is to change that. The book is organized into a core set of chapters (that cover the standard material suggested by the title), followed by a set of appendix chapters that highlight application areas including programming language design, compilers, software verification, networks, security, natural language processing, artificial intelligence, game playing, and computational biology. The core material includes discussions of finite state machines, Markov models, hidden Markov models (HMMs), regular expressions, context-free grammars, pushdown automata, Chomsky and Greibach normal forms, context-free parsing, pumping theorems for regular and context-free languages, closure theorems and decision procedures for regular and context-free languages, Turing machines, nondeterminism, decidability and undecidability, the Church-Turing thesis, reduction proofs, Post Correspondence problem, tiling

problems, the undecidability of first-order logic, asymptotic dominance, time and space complexity, the Cook-Levin theorem, NP-completeness, Savitch's Theorem, time and space hierarchy theorems, randomized algorithms and heuristic search. Throughout the discussion of these topics there are pointers into the application chapters. So, for example, the chapter that describes reduction proofs of undecidability has a link to the security chapter, which shows a reduction proof of the undecidability of the safety of a simple protection framework.

Fogfinger rules Venice. His Fog Squad and spies are everywhere. The Venetians fear him and obey him. Every year one of their children is lost in a grisly Lambing ceremony. The child must climb the bell tower and let the Fate in the Box decide their destiny. Most end their days in the jaws of the primeval Crocodile that lurks in the lagoon. Or so Fogfinger tells them. But a chance meeting by a green apricot tree between Amneris and Tockle may be the beginning of the end for Fogfinger. Silk and sewing, a magical glass kaleidoscope, mermaids and misunderstood Sea-Saurs, talking statues and winged cats, blue glass sea-horses, a spoiled rich girl and a secret society are just some of the ingredients in Michelle Lovric's exquisitely imagined and superbly plotted fourth fantasy set in Venice.

This beautiful book draws on Robert Race's extensive collection of traditional moving toys, looking at the ways the makers have achieved remarkable and varied results, often with very limited resources. Each chapter begins by looking at the mechanisms and materials used in some of these traditional moving toys, goes on to consider possible variations, and describes how to make a related moving toy. It continues, from this basis, to develop a design for an automaton. The book shows that designing and making these simple but wonderfully satisfying mechanical devices is fun, and that good results can be achieved in many different ways, using

a variety of materials, tools and equipment such as wood and wire, card and paper, bamboo, string, tin plate and feathers. It exploits, in a simple way, mechanisms such as levers, linkages, cranks and cams. It explores different ways of moving those mechanisms directly by hand, by springs or falling weights, and by the wind. Beautifully illustrated with 117 colour images. Enter the world of animated paper engineering with these 14 whimsical projects for making automata out of cardstock. Full step-by-step instructions plus precise cut-and-assemble components suitable for papercrafters ages 12 and up.

Artist, inventor, and longtime author Rodney Frost is known for wacky, whimsical woodworking books that encourage readers to experiment. With his newest, most creative volume yet, he provides an introduction to the wild and whimsical world of kinetic art—art that moves. Using plenty of informative sidebars and dynamic illustrations, Frost teaches the basic techniques in his own inimitable style, beginning with easy, fun projects like weather vanes and mobiles powered by air currents alone. Then it's on to simple toys you manipulate with strings, and art mechanized by levers, cranks, cams, and cogs. Far from a routine woodworking book, *Creative Kinetics* will inspire even the least craft-minded reader to pick up some scissors and turn a tuna can into a propeller or cardboard into a jumping-jack.

"The history of automata and mechanical toys covers the early inventors from Hero of Alexandria, through the mechanical marvels of the eighteenth and nineteenth centuries, to contemporary automata and the influence exerted by Calder's Circus, Sam Smith and Cabaret Mechanical Theatre."--Back cover.

shaping technological change. Steven Johnson argues that, throughout history, the cutting edge of innovation lies wherever people are working the hardest to keep themselves and others amused. Johnson's storytelling is just as delightful as the inventions he describes, full of surprising stops along the journey from simple concepts to complex modern systems. He introduces us to the colorful innovators of leisure: the explorers, proprietors, showmen, and artists who changed the trajectory of history with their luxurious wares, exotic meals, taverns, gambling tables, and magic shows. In *Wonderland*, Johnson compellingly argues that observers of technological and social trends should be looking for clues in novel amusements. You'll find the future wherever people are having the most fun.

The automaton is the playful collaboration of the artist and the artisan, with sculpture, painting, music, costume, and mechanics all playing a part in its creation. In *Automata: The Golden Age*, Christian Bailly opens with a depiction of mid-19th-century Paris, where French automaton-makers lived and worked. There follow the little-known histories of the seven leading makers, from their establishment mid-century to the decline of production after the First World War.
