Over the last few years, games of different types have been successfully used in the teaching of production management and in the introduction of new planning methods and systems in industrial enterprises. Games have been used to explain the dynamic nature of production management and for testing new planning principles. Company-specific games have recently been involved as part of developing new production management systems. Offices, as a category of building, have probably faced more challenges and undergone more dramatic changes in the last few years than most other kinds of buildings. Increasing economic globalization, new information and communication technologies, and ecological considerations are all making demands on a branch of architecture which for nearly a century had been marked by the construction norms and standards, and the requirements of office organisation. These old solutions are, however, no longer viable for many

modern companies, where flexibility and mobility determine the working day of a new generation of office nomads, and architecture is having to adapt. With some 70 significant international examples taken from the last five years (including examples from Norman Foster, Frank O. Gehry, Thomas Herzog, Morphosis MVRDV, Renzo Piano, SOM), the authors and editors show how the new issues facing architects can be resolved. In addition to introductory texts there are also thematic contributions by experts, in various disciplines on related topics including the new models of work organisation, facade technology, climatic regulation, lighting etc. Similar to our enormously successful Floor Plan Atlas, this volume will be a crucial standard work in the design of offices.

Bang & Olufsen, the famous Danish producer of high-end home electronics, is well known as an early exponent of value-based management: the idea that there should be consistency in what the organisation does, a certain continuity between what the company develops and sells, and the beliefs and practices of the employees. This study investigates how company values are communicated and the collective identity is articulated through the use of such concepts as 'culture', 'fundamental values', and 'corporate religion', as well as how employees negotiate these ideas in their daily working lives. As this book reveals, the identification of values, meant to create cohesion and solidarity among employees, came to symbolise and engender a split between the staff and the other parts of the company. By examining the rise and fall of the value-based management approach, this volume offers the indispensable insight of anthropological enquiry to expose how social realities challenge conventional management strategies and therefore must be considered in the development of new management techniques.

The aim of this book is to support industry in their effort to design environmentally friendly products. The book comprises a method and a manual for life cycle assessment of products and it includes examples of how industrial companies have used the method successfully in the design of more environmentally friendly products. The method has been developed over a period of four years under the Danish EDIP programme (Environmental Design of Industrial Products) by a team representing the Technical University of Denmark, five Danish industrial companies, the Confederation of Danish Industries and the Danish Environmental Protection Agency. The method is coherent and operational and it is well documented by a large variety of examples including five different complex electromechanical products. It guides the user through the inventory and assessment of environmental impacts of products and shows how various products and design solutions during product development can be compared.

The method is supported by a base of data for the assessments of environmental impacts and is thus designed as a tool which will make it possible for the user to start on life cycle assessment at once. The book also guides the user through the identification of environmental improvement potentials in the product and the setting of environmental specifications within the general concept of overall commercial optimization. The partnership between industry, authorities and university has been highly fruitful.

This book explores the intersection of craft, design and sustainability in the developing world. It argues that most sustainable design approaches and efforts fall short of implementing holistic sustainability, and in order to reach this goal, design must be underpinned by alternatives to the mainstream, technology-intensive, industrial design paradigm. Renewable materials such as bamboo, cork and

hemp – which are abundantly available in the developing world – have the potential to be a viable resource base for sustainable development. Current sustainable design initiatives and approaches already recontextualize these materials using industrial techniques and technologies. However, these efforts fall short of impacting holistic sustainability and tend to focus on the ecological aspect. This book offers the development of one alternative to design for holistic sustainability, called the Rhizome Approach, which draws on existing sustainability praxis and craft. *Holistic Sustainability Through Craft-Design Collaboration* includes customizable tools which aim to empower designers to guide and evaluate their own designs. Through these tools, and the Rhizome Approach in general, the book aims to enable designers, and students of design, to move beyond green and sustainable design, to holistic sustainability design.
