Stemming from a 2012 conference entitled Brain Degenerations and Emerging Mental Health Challenges in Sub-Saharan Africa, this book is aimed at both the general practitioner interested in CNS disorders, and the specialist who would like to know more about CNS pathology in Africa. By employing a broad definition of what brain degeneration means, the authors are able to touch upon everything from dementias and CNS malignancy to traumatic brain injury and CNS infective processes. This book draws from and builds upon the original conference presentations, and incorporates the most up-to-date science behind brain degeneration as well as actual case reports. Each of the book's six sections offer the reader a deeper understanding of brain degeneration as it exists in Sub-Saharan Africa.

Major Depressive Disorder (MDD) is found in about 20% of university students, with increasing incidence in the past two decades (American College Health Association, 2010). Depressed college students report significant academic problems, including lower grade point average, inability to concentrate, absenteeism, lower academic productivity, and interpersonal problems. Mindfulness-Based Stress Reduction (MBSR) and Behavioral Activation (BA) are two interventions that have significant potential in meeting demands of college counseling clinics insofar as treating depressed college students. This study utilized a randomized controlled design (n = 50) to examine the efficacy of four-sessions of abbreviated MBSR and BA relative to a no-treatment control condition with depressed college students. Results suggested both treatments were efficacious compared to the wait-list control group, there was strong therapist competence and adherence to protocols, and there were significant pre-post treatment gains across a breadth of outcome measures assessing depression, rumination, stress, and mindfulness. However, neither treatment effectively reduced self-reported somatic anxiety. Across both treatments, gains were associated with strong effect sizes, and based on response and remission criteria, approximately 56-79% of patients exhibited clinically significant improvement. There were no significant differences in outcomes as a function of active intervention at post-treatment, and treatment gains largely were maintained at 1-month follow-up. Study limitations and implications for the assessment and treatment of depressed college students are discussed.

Behavioral Activation for Depression A Clinician's Guide Guilford Press

From leading experts in behavioral activation research and clinical practice, this volume presents an empirically tested approach for helping clients overcome depression by becoming active and engaged in their own lives. Behavioral activation is a stand-alone treatment whose principles can be integrated easily with other approaches that therapists already use. Guidelines are presented for identifying individualized treatment targets, monitoring and scheduling "antidepressant" activities--experiences that are likely to be rewarding and pleasurable--and decreasing avoidance and ruminative thinking. Rich clinical illustrations include an extended case example that runs throughout the book.

Twenty-two reproducible forms, worksheets, and tables can be downloaded and printed in a convenient 8 1/2" x 11" size.

The exponential growth of clinical psychology since the late 1960s can be measured in part by the extensive--perhaps exhaustive--literature on the subject. This proliferation of writing has continued into the new century, and the field has come to be defined as much by its many topics as its many voices. The Oxford Handbook of Clinical Psychology synthesizes these decades of literature in one extraordinary volume. Comprising chapters from the foremost scholars in clinical psychology, the handbook provides even and authoritative coverage of the research, practice, and policy factors that combine to form today's clinical psychology landscape. In addition to core sections on topics such as training, assessment, diagnosis, and intervention, the handbook includes valuable chapters devoted to new and emerging issues in the clinical field, including health care reforms, cultural factors, and technological innovations and challenges. Each chapter offers a review of the most pertinent literature, outlining current issues and identifying possibilities for future research. Featuring two chapters by Editor David H. Barlow -- one on changes during his own 40-year odyssey in the field, the other projecting ten themes for the future of clinical psychology -- The Oxford Handbook of Clinical Psychology is a landmark publication that is sure to serve as the field's benchmark reference publication for years to come. It is an essential resource for students, clinicians, and researchers across the ever-growing clinical psychology community.

This volume introduces the principles and techniques of tumor targeting and critically surveys their applications from laboratory to bedside. By concisely synthesizing the many technical details, the authors illuminate this innovative technique, ranging from the fundamentals of drug targeting and in vivo and in vitro experimentation, to such emerging therapeutic uses as radioimmunotherapy, radioimmunodetection, therapy with cytotoxic antibodies, immunotoxins, enzyme prodrug immunotherapy, and immunotherapeutics with fusion proteins.

Behavioral activation theory indicates that much clinically relevant human behavior is a function of positive reinforcement, and that when positive reinforcement is reduced, lost, or chronically low depression results. Behavioral activation encourages clients to obtain and nurture the skills that allow them to establish and maintain contact with diverse, stable sources of positive reinforcement. This creates a life of meaning, value and purpose. Behavioral Activation: Distinctive Features clarifies the fundamental theoretical and practical features of behavioral activation, integrating various techniques into a unified whole that is efficient and effective. The book includes numerous case examples and transcribed segments from therapy sessions and outlines behavioral concepts using straightforward terms and examples so that all therapists can see the utility and practical value of this approach. This book will provide essential guidance for students and new therapists, as well as more experienced clinicians wanting to know more about what makes behavioral activation a distinct form of cognitive behavior therapy.

This concise practice-oriented manual effectively shows how psychologists, psychiatrists, social workers, supervisors, and counselors can quickly identify and put to therapeutic use an individual's own talents and resources. Written in an easy and relaxed style using everyday language, this manual illustrates how to actively take a person's resources into consideration during therapy and counseling sessions, and how to integrate them into existing intervention concepts. The first part illustrates approaches that can be used to focus attention on assessment and dialog, and that shed light on a person's individual resources from various angles. These therapeutic approaches can be used in the framework of existing manuals and guidelines to focus on how to "do things." The second part illustrates procedures offering a framework for further applying the different perspectives and provides sample worksheets for practical use.

Travels with the Self uses a hermeneutic perspective to critique psychology and demonstrate why the concept of the self and the modality of cultural history are so vitally important to the profession of psychology. Each chapter focuses on a theory, concept, sociopolitical or professional issue, philosophical problem, or professional activity that has rarely been critiqued from a historical, sociopolitical vantage point. Philip Cushman explores psychology's involvement in consumerism, racism, shallow understandings of being human, military torture, political resistance, and digital living. In each case, theories and practices are treated as historical artifacts, rather than expressions of a putatively progressive, modern-era science that is uncovering the one, universal truth about human being. In this way, psychological theories and practices, especially pertaining to the concept of the self, are shown to be reflections of the larger moral understandings and political arrangements of their time and place, with implications for how we understand the self in theory and clinical practice. Drawing on the philosophies of critical theory and hermeneutics, Cushman insists on understanding the self, one of the most studied and cherished of psychological concepts, and its ills, practitioners, and healing technologies, as historical/cultural artifacts — surprising, almost sacrilegious, concepts. To this end, each chapter begins with a historical introduction that locates it in the historical time and moral/political space of the nation's, the profession's, and the author's personal context. Travels with the Self brings together highly unusual and controversial writings on contemporary psychology that will appeal to psychoanalysts and psychotherapists, psychologists of all stripes, as well as scholars of philosophy, history, and cultural studies.

Presents the clinical applications of cognitive-analytic therapy (CAT) in treating patients in both primary care and outpatient settings and as an initial treatment for seriously disturbed patients. Delineates the reformulation process in which patients actively participate in defining their problems and modifying their behavior. Describes general treatment methods, more complex reformulations of patients' difficulties and treatment of the more severely disturbed patient. Also discusses the use of CAT procedures in long-term therapy, in couple therapy and in various work settings. Ideas and methods are illustrated with several case descriptions, studies from therapists and patients and directly recorded material from sessions.

This book is the first to present the mechanism which explains why light is an effective treatment for so many illnesses and diseases. The book not only explains this mechanism, but describes uses for the mechanism, as well as what new work is planned and what changes will be seen in FDA regulations. Extensive papers and coverage on many interesting topics are included.

This publication provides a critical overview on some research mainly conducted in Paris and Geneva. It aims to review the neurophysiological basis of body perception and schema in health and sickness, as well as widely accepted psychotherapeutic procedures based on corporality. Psychiatrists, psychologists, social workers, psychomotor therapists, psychotherapists and neurologists will find a wealth of information in this book that has until now been unavailable in English scientific literature.

LSIT is based on the scientific foundation of quantum physics. This deals with holistic structures and their interactions. The high dynamics of life is achieved by constantly changing relationships and opportunities, combined with a high gain of experience. This improves the adaptability and the chances of survival. Everything is subject to a higher meaning communicated to us about spiritual needs. We are spirit-driven beings who inhabit a body subject to electrodynamic laws. Each action requires information and energy, which we call up about our intentions. Diseases can be treated with medication. These transmit certain healing information. The LSIT uses this information directly, without need of pills. That's what makes them so efficient. It is capable of initiating healing processes even in advanced diseases. The author, Dr Bodo Koehler, MD, born in 1948, has more than 45 years of experience in the clinic and his own practice as an internist with extensive additional training. Since 1980 he has been one of the pioneers of bioenergetic measurement and therapy procedures. A lot of his developments are now standard in many practices. The author is a lecturer at home and abroad.

\_\_\_\_\_ 'A masterly exposition of REBT skills by a master practitioner of them. An essential addition to your REBT reading list.'

Michael Neenan, Centre for REBT, Bromley, Kent. *Skills in Rational Emotive Behaviour Counselling and Psychotherapy* is a practical guide to the application of the rational emotive behaviour approach at each stage of the therapeutic process. Taking the reader through these stages, the book focuses on skills which arise out of rational emotive behaviour theory (REBT) as well as those invoked by the therapeutic relationship. Accessibly written by the authority in this field, Windy Dryden uses his 30 years of experience in REBT training to draw on skills that trainees and those seeking to incorporate REBT into their existing practice find particularly difficult. He discusses: - theoretical and practical features of REBT and the importance of the therapeutic alliance - the skills involved in the active-directive approach - specific examples of clients' problems. - helping clients to identify and deal with core irrational beliefs - homework negotiation - common reasons for and skills in responding to client lack of progress For all those training in REBT or who wish to sharpen their skills as practitioners, this is essential reading.

The book is divided into two parts: Part I deals with the relevant physics and planning algorithms of protons (H Breuer) and Part II with the radiobiology, radiopathology and clinical outcomes of proton therapy and a comparison of proton therapy versus photon therapy (BJ Smit). Protons can be used for radiosurgery and general radio therapy. Since proton therapy was first proposed in 1946 by Wilson, about sixteen facilities have been built globally. Only a very few of these have isocentric beam delivery systems so that proton therapy is really only now in a position to be compared directly by means of randomised clinical trials, with modern photon radiotherapy therapy systems, both for radiosurgery and for general fractionated radiotherapy. Three-dimensional proton planning computer systems with image fusion (image of computerised tomography (CT), magnetic resonance registration) capabilities imaging (MRI), stereotactic angiograms and perhaps positron emission tomography (PET) are essential for accurate proton therapy planning. New planning systems for spot scanning are under development. Many of the older comparisons of the advantageous dose distributions for protons were made with parallel opposing or multiple co-planar field arrangements, which are now largely obsolete. New comparative plans are necessary once more because of the very rapid progress in 3-D conformal planning with photons. New cost-benefit analyses may be needed. Low energy (about 70 MeV) proton therapy is eminently suitable for the treatment of eye tumours and has firmly established itself as very useful in this regard.

This new book challenges the medical model of the psychotherapist as healer who merely applies the proper nostrum to make the client well. Instead, the authors view the therapist as a coach, collaborator, and teacher who frees up the client's innate tendency to heal. This book offers provocative reading for clinicians intrigued by the process of therapy and the process of change.

The original edition of Klaus Grawe's book exploring the basis and need for a more generally valid concept of psychotherapy fueled a lively debate among psychotherapists and psychologists in German-speaking areas. Now available in English, this book will help spread the concepts and the debate among a wider audience. The book is written in dialog form. A practicing therapist, a research psychologist, and a therapy researcher take part in three dialogs, each of which builds on the results of the previous dialog. The first dialog explores how therapeutic change takes place, while the second looks at how the mechanisms of action of psychotherapy can be understood in terms of basic psychological concepts. Finally, in the third dialog, a psychological theory of psychotherapy is developed. The practical implications of this are clearly shown in the form of case examples, as well as guidance on indications and treatment planning. The dialog ends with suggestions as to how therapy training and provision of psychotherapy could be improved on the basis of the model of psychotherapy that has been developed.

This book uniquely combines CBT with the Department of Health stepped care model to provide the first comprehensive case study-approach textbook. A step-by-step guide to using CBT, the book is structured around case studies of clients who present with the most commonly encountered conditions; from mild to more complex, enduring symptoms and diagnosis. This distinctive practical format is ideal in showing how to put the principles of CBT and stepped care into effect. As well as echoing postgraduate level training, it provides an insight into the experiences the trainee will encounter in real-world practice. Each chapter addresses a specific client condition and covers initial referral, presentation and assessment, case formulation, treatment interventions, evaluation of CBT strategies and discharge planning. Specific presenting problems covered include: - First onset and chronic Depression - Social Phobia - Obsessive-Compulsive Disorder - Generalised Anxiety Disorder (GAD) - Chronic Bulimia Nervosa and Anorexia nervosa - Alcohol Addiction - Personality Disorder The book also includes practical learning exercises for the reader and clinical hints, as well as extensive reference to further CBT research, resources and reading. This timely text will be invaluable for trainees on Improving Access to Psychological Therapies (IAPT) programmes, and anyone studying on postgraduate CBT courses.

The available parenteral and oral anticoagulants have a large clinical use. Understanding biochemistry of anticoagulants may help to improve therapeutic strategies. Resistance to vitamin K antagonist drugs might be a problem for rodent populations. Patients who have thrombogenic risk factors should be anticoagulated. The need for cardiac implantable electronic devices is increasing, and there is a substantial number of patients who are on oral anticoagulant therapy. Prothrombin complex concentrate and other plasma concentrates are useful to deal with over-coagulated situations. The efficacy and safety of non-vitamin K antagonist oral anticoagulants have been proven in large phase III trials. The real-world data suggest even better outcomes with

these agents compared to vitamin K antagonists.
