Neuropsychological Evaluation of the Child: Domains, Methods, and Case Studies, Second Edition, is an updated and expanded desk reference that retains the first edition's organizational structure, strong practical focus, and lifespan developmental perspective. It is a unique compilation of published and unpublished pediatric neuropsychological test normative data that contains extensive discussion of assessment methods and case formulation. Added for the first time are instructive clinical case vignettes that explicate brain-behavior relationships in youth, from preschool-age through adolescence. These cases illustrate immediate and late effects that result from common and rare medical diseases and psychological disorders, and highlight key issues that arise when examining a child's maturational trajectory and brain-behavioral relationships using convergence profile analysis. Part I, Child Neuropsychology: Current Status, contains four introductory chapters regarding definitions, education and training, and professional roles; reasons for referral; typical and atypical brain development; and clinical practice considerations. In Part II, Clinical Issues, discussion covers the procedural steps of neuropsychological assessment, behavioral assessment techniques, observational data, and oral and written communication of results. These chapters are followed in Part III, Domains and Tests, by extended coverage of topics and tests related to the major neuropsychological domains: intelligence, executive function, attention and processing speed, language, motor and sensory-perceptual function, visuo-perceptual, visuospatial and visuoconstructional function, and learning and memory. A final chapter addresses deception in childhood, reasons why a child might reduce effort and invalidate assessment, and the use of performance validity tests, symptom validity tests, and embedded validity indicators to assess noncredible effort. Each of the 16 chapters includes definitions, theoretical concepts, models, and assessment techniques that are essential knowledge for clinical and research pediatric neuropsychologists.

Abstract: Purpose: The objective of this research was to evaluate whether children with below age-level visual perceptual skill who perform home-based visual perception therapy using the Perceptual Therapy System II: PTS II iNet (PTS II) would show improvements in performance on standardized tests of academic achievement, attention and memory and/or reported problem behaviors. **Methods:** Children 6 to 13 years of age with below age-level performance on a standardized test of visual perception (the Beery-Buktenica Developmental Test of Visual Motor Integration, 5th Edition [VMI], the Beery VMI supplemental test of Visual Perception [VP], or the Test of Visual Perceptual Skills, 3rd Edition [TVPS-3]) were invited to participate. Children with a score of 80 or below on the Kaufman Brief Intelligence Test, 2nd Edition (KBIT-2) were excluded. Children received the PTS II and were prescribed home therapy for 20 minutes a day, 5 days per week, for 16 weeks. Testing at baseline and outcome consisted of The Wechsler Individual Achievement Test - Second Edition (WIAT-2) Reading and Mathematics subtests (Word Reading, Reading Comprehension, Pseudodecoding, and Numerical Operations), the Cognitive Assessment System (CAS) Attention and Figure Memory subtests (Expressive Attention, Number Detection, Receptive Attention, and Figure Memory), and the Conners' Parental Rating Scales-Revised (S) (Conners'). One sample t-test analysis was used to compare baseline and outcome test scores to published normative values. Wilcoxon Signed-Rank test analysis determined if significant changes occurred between baseline and outcome test scores. Linear regression was performed to examine the effect of compliance. **Results:** Twenty-five children enrolled and twenty children (mean age 9.61 years) completed the study. At baseline, children scored on average significantly below the published normative means on CAS Expressive Attention and Number Detection ($p = .003$ and $.029$, respectively), the composite CAS Attention standard score ($p = .001$), and the WIAT-2 Word Reading, Pseudodecoding, and Numerical Operations subtests ($p = .006$, $.001$, and $.002$, respectively). Baseline scores were significantly above the published normative mean on the Conners' Cognitive Problems/Inattention (p
