A fascinating, entertaining dive into the long-standing relationship between humans and insects, revealing the surprising ways we depend on these tiny, six-legged creatures. Insects might make us shudder in disgust, but they are also responsible for many of the things we take for granted in our daily lives. When we bite into a shiny apple, listen to the resonant notes of a violin, get dressed, receive a dental implant, or get a manicure, we are the beneficiaries of a vast army of insects. Try as we might to replicate their raw material (silk, shellac, and cochineal, for instance), our artificial substitutes have proven subpar at best, and at worst toxic, ensuring our interdependence with the insect world for the foreseeable future. Drawing on research in laboratory science, agriculture, fashion, and international cuisine, Edward D. Melillo weaves a vibrant world history that illustrates the inextricable and fascinating bonds between humans and insects. Across time, we have not only coexisted with these creatures but have relied on them for, among other things, the key discoveries of modern medical science and the future of the world's food supply. Without insects, entire sectors of global industry would grind to a halt and essential features of modern life would disappear. Here is a beguiling appreciation of the ways in which these creatures have altered--and continue to shape--the very framework of our existence.

The international bee crisis is threatening our global food supply, but this user-friendly field guide shows what you can do to help protect our pollinators. The Xerces Society for Invertebrate Conservation offers browsable profiles of 100 common flowers, herbs, shrubs, and trees that support bees, butterflies, moths, and hummingbirds. The recommendations are simple: pick the right plants for pollinators, protect them from pesticides, and provide abundant blooms throughout the growing season by mixing perennials with herbs and annuals! 100 Plants to Feed the Bees will empower homeowners, landscapers, apartment dwellers — anyone with a scrap of yard or a window box — to protect our pollinators.

The passion and urgency that inspired WWI and WWII Victory Gardens is needed today to meet another threat to our food supply and our environment—the steep decline of pollinators. The Pollinator Victory Garden offers practical solutions for winning the war against the demise of these essential animals. Pollinators are critical to our food supply and responsible for the pollination of the vast majority of all flowering plants on our planet. Pollinators include not just bees, but many different types of animals, including insects and mammals. Beetles, bats, birds, butterflies, moths, flies, and wasps can be pollinators. But, many pollinators are in trouble, and the reality is that most of our landscapes have little to offer them. Our residential and commercial landscapes are filled with vast green pollinator deserts, better known as lawns. These monotonous green expanses are ecological wastelands for bees and other pollinators. With *The Pollinator Victory Garden*, you can give pollinators a fighting chance. Learn how to transition your landscape into a pollinator haven by creating a habitat that includes pollinator nutrition, larval host plants for butterflies and moths, and areas for egg laying, nesting, sheltering, overwintering, resting, and warming. Find a wealth of information to support pollinators while improving the environment around you:
