The classic personal account of Watson and Crick's groundbreaking discovery of the structure of DNA, now with an introduction by Sylvia Nasar, author of A Beautiful Mind. By identifying the structure of DNA, the molecule of life, Francis Crick and James Watson revolutionized biochemistry and won themselves a Nobel Prize. At the time, Watson was only twenty-four, a young scientist hungry to make his mark. His uncompromisingly honest account of the heady days of their thrilling sprint against other world-class researchers to solve one of science's greatest mysteries gives a dazzlingly clear picture of a world of brilliant scientists with great gifts, very human ambitions, and bitter rivalries. With humility unspoiled by false modesty, Watson relates his and Crick's desperate efforts to beat Linus Pauling to the Holy Grail of life sciences, the identification of the basic building block of life. Never has a scientist been so truthful in capturing in words the flavor of his work.

In *Germs, Genes and Civilization*, Dr. David Clark tells the story of the microbe-driven epidemics that have repeatedly molded our human destinies. You'll discover how your genes have been shaped through millennia spent battling against infectious diseases. You'll learn how epidemics have transformed human history, over and over again, from ancient Egypt to Mexico, the Romans to Attila the Hun. You'll learn how the Black Death epidemic ended the Middle Ages, making possible the Renaissance, western democracy, and the scientific revolution. Clark demonstrates how epidemics have repeatedly shaped not just our health and genetics, but also our history, culture, and politics. You'll even learn how they may influence religion and ethics, including the ways they may help trigger cultural cycles of puritanism and promiscuity. Perhaps most fascinating of all, Clark reveals the latest scientific and philosophical insights into the interplay between microbes, humans, and society - and previews what just might come next.

Fully updated for DSM-5, this exciting revision complements the abnormal

psychology course by providing 17 case histories based on the authors' clinical experiences. Each case study goes beyond DSM-5 diagnosis to describe the individual's history and symptoms, a theoretical discussion of treatment, a specific treatment plan, the actual treatment conducted, and assessment questions for students. The casebook also provides three "You Decide" cases -- written without diagnosis or treatment, so students can identify disorders and suggest appropriate therapies. This new edition adds assessment questions to the end of each case and also features three brand new cases: hoarding, somatic symptom disorder, and gender dysphoria.

This book is an invaluable resource with 400 self-assessment cases and data interpretation questions covering all aspects of internal medicine. It has great breadth of coverage, superb illustration, lively presentation, precise answers and detailed discussion.

The birth of bacterial genomics since the mid-1990s brought with it several conceptual modifications and wholly new controversies. Working beyond the scope of the neo-Darwinian evolutionary synthesis, a group of leading microbial evolutionists addresses the following and related issues, often with markedly varied viewpoints: ? Did the eukaryotic nucleus, cytoskeleton and cilia also originate from symbiosis? ? Do the current scenarios about the origin of mitochondria and plastids require revision? ? What is the extent of lateral gene transfer (between "species") among bacteria? ? Does the rDNA phylogenetic tree still stand in the age of genomics? ? Is the course of the first 3 billion years of evolution even knowable?
