This book is an introduction to the language and standard proof methods of mathematics. It is a bridge from the computational courses (such as calculus or differential equations) that students typically encounter in their first year of college to a more abstract outlook. It lays a foundation for more theoretical courses such as topology, analysis and abstract algebra. Although it may be more meaningful to the student who has had some calculus, there is really no prerequisite other than a measure of mathematical maturity.

"Illustrated Textbook of Neuroanatomy" Presents a comprehensive yet lucid and friendly coverage of neuroanatomy & explains the concepts in a simple and easy-to-understand language.

Published by OpenStax College, U.S. History covers the breadth of the chronological history of the United States and also provides the necessary depth to ensure the course is manageable for instructors and students alike. U.S. History is designed to meet the scope and sequence requirements of most courses. The authors introduce key forces and major developments that together form the American experience, with particular attention paid to considering issues of race, class and gender. The text provides a balanced approach to U.S. history, considering the people, events and ideas that have shaped the United States from both the top down (politics, economics, diplomacy) and bottom up (eyewitness accounts, lived experience).

Told entirely in text messages, this addictive new series from the acclaimed author of *My Life in Pink & Green* is perfect for fans of Lauren Myracle and Wendy Mass. To be honest, middle school is rough! Cecily, Gabby, and Prianka have been BFFAE since pre-K, so it's totally natural when they don't include the new girl, Victoria, in their plans and group texts. Between organizing the school Valentine's Day dance, prepping for their first boy-girl party, and trying to keep their texts so boring their moms won't use spy apps to read them, the friends only have time for each other. But when Victoria is accidentally sent a hurtful text message, the entire sixth grade gets called out for bullying, cell phones are confiscated, and the trio known as CPG4Eva is forced to figure out just how strong their friendships are IRL.

An introduction to a broad range of topics in deep learning, covering mathematical and conceptual background, deep learning techniques used in industry, and research perspectives. "Written by three experts in the field, Deep Learning is the only comprehensive book on the subject." —Elon Musk, cochair of OpenAI; cofounder and CEO of Tesla and SpaceX Deep learning is a form of machine learning that enables computers to learn from experience and understand the world in terms of a hierarchy of concepts. Because the computer gathers knowledge from experience, there is no need for a human computer operator to formally specify all the knowledge that the computer needs. The hierarchy of concepts allows the computer to learn complicated concepts by building them out of simpler ones; a graph of these hierarchies would be many layers deep. This book introduces a broad range of topics in deep learning. The text offers mathematical and conceptual background, covering relevant concepts in linear algebra, probability theory and information theory, numerical computation, and machine learning. It describes deep learning techniques used by practitioners in industry, including deep feedforward networks, regularization, optimization algorithms, convolutional networks, sequence modeling, and practical methodology; and it surveys such applications as natural language processing, speech recognition, computer vision, online recommendation systems, bioinformatics, and videogames. Finally, the book offers research perspectives, covering such theoretical topics as linear factor models, autoencoders, representation learning,

structured probabilistic models, Monte Carlo methods, the partition function, approximate inference, and deep generative models. Deep Learning can be used by undergraduate or graduate students planning careers in either industry or research, and by software engineers who want to begin using deep learning in their products or platforms. A website offers supplementary material for both readers and instructors.

It was a long time ago and few alive now remember what life was like in England in the years after World War II. Yes, the Luftwaffe and Vengeance weapons had made a fine mess in the south of the country, but during the war years the Yanks were there, millions of them, seducing the womenfolk, brawling in pubs, and, most importantly, spending their pay with local shopkeepers. May, 1945, the war ended and all the Americans left. Most went home, but a sizeable contingent set up shop in Germany, where, to the best of their ability given the local ruins, they carried on as before, seducing the womenfolk, brawling in pubs and spending their pay with the surviving shopkeepers. The Americans were joined by contingents of English, French and Soviet troops. As a result, the surprising fact, long forgotten, is that after the war, conditions in England were even worse than they were in post-Third Reich Germany. Some in Britain rued winning the war, as deprivation became their fate. In London after the war books were so scarce that used vendors had long lists of people waiting for the few books that turned up. For schools in London which taught astrology, the situation was impossible. Responding to the post WWII book shortage, Margaret Hone published this ultimate Astrology Text-Book. She was born in Birmingham, England, on October 2, 1892, at 2:13 am. Her ascendant was 27 Leo; her Sun was 9 Libra; her Moon was 13 Aquarius. Her midheaven was 15 Taurus. Of Ms Hone, James Holden wrote, "English astrologer, educator, and author. She was a professional astrologer and private teacher for many years and later was Principal and Director of Studies of the Faculty of Astrological Studies 1954-1969 and Vice President of the Astrological Lodge of London. Mrs. Hone was an advocate of the Equal House system of house division. She is best known in the U.S. for her two instruction manuals." This book is dedicated to Charles E.O. Carter, 1887-1968. Carter succeeded Alan Leo as head of the Astrological Lodge (1920-1952) and was First Principal of the Faculty of Astrological Studies, which he helped found in 1948. Hone succeeded Carter at FAS. She passed away on October 14, 1969. In his Preface, while quick to praise Hone, a personal friend, Charles Carter also pointed out that this book's high price was justified, that "padding has been rigorously excluded." He goes on to praise the workmanship, the carefully worded definitions, as well as the fact that the book was complete and entire in itself. Save for ephemeris and tables of houses, this one book would suffice beginning as well as advanced students for some years. In addition, Hone also includes one of the earliest modern histories of astrology, short biographies of leading astrologers past and present, astrology and public opinion (daily horoscopes in the newspapers were a recent innovation). On a more practical side, Hone gives a thorough analysis of the principal house systems of the day (Equal, Campanus, Regiomontanus, Placidus), and even mentions C.G. Jung's recently developed Depth Psychology.

Much of the data available today is unstructured and text-heavy, making it challenging for analysts to apply their usual data wrangling and visualization tools. With this practical book, you'll explore text-mining techniques with tidytext, a package that authors Julia Silge and David Robinson developed using the tidy principles behind R packages like ggraph and dplyr. You'll learn how tidytext and other tidy tools in R can make text analysis easier and more effective. The authors demonstrate how treating text as data frames enables you to manipulate, summarize, and visualize characteristics of text. You'll also learn how to integrate natural language processing (NLP) into effective workflows. Practical code examples and data explorations will help you generate real insights from literature, news, and social media. Learn how to apply the tidy text format to NLP Use sentiment analysis to mine the emotional content of text Identify a document's most important terms with frequency measurements Explore relationships and connections between words with the ggraph and widyr packages Convert back and forth between R's tidy and non-tidy text formats Use topic modeling to classify document collections into natural groups Examine case studies that compare Twitter archives, dig into NASA metadata, and analyze thousands of Usenet messages

According to the great mathematician Paul Erdős, God maintains perfect mathematical proofs in The Book. This book presents the authors candidates for such "perfect proofs," those which contain brilliant ideas, clever connections, and wonderful observations, bringing new insight and surprising perspectives to problems from number theory, geometry, analysis, combinatorics, and graph theory. As a result, this book will be fun reading for anyone with an interest in mathematics.

Toward the end of the year 1920 the Government of the United States had practically completed the programme,

adopted during the last months of President Winthrop's administration. The country was apparently tranquil. Everybody knows how the Tariff and Labour questions were settled. The war with Germany, incident on that country's seizure of the Samoan Islands, had left no visible scars upon the republic, and the temporary occupation of Norfolk by the invading army had been forgotten in the joy over repeated naval victories, and the subsequent ridiculous plight of General Von Gartenlaube's forces in the State of New Jersey. The Cuban and Hawaiian investments had paid one hundred per cent and the territory of Samoa was well worth its cost as a coaling station. The country was in a superb state of defence. Every coast city had been well supplied with land fortifications; the army under the parental eye of the General Staff, organized according to the Prussian system, had been increased to 300,000 men, with a territorial reserve of a million; and six magnificent squadrons of cruisers and battle-ships patrolled the six stations of the navigable seas, leaving a steam reserve amply fitted to control home waters. The gentlemen from the West had at last been constrained to acknowledge that a college for the training of diplomats was as necessary as law schools are for the training of barristers; consequently we were no longer represented abroad by incompetent patriots. The nation was prosperous; Chicago, for a moment paralyzed after a second great fire, had risen from its ruins, white and imperial, and more beautiful than the white city which had been built for its plaything in 1893. Everywhere good architecture was replacing bad, and even in New York, a sudden craving for decency had swept away a great portion of the existing horrors. Streets had been widened, properly paved and lighted, trees had been planted, squares laid out, elevated structures demolished and underground roads built to replace them. The new government buildings and barracks were fine bits of architecture, and the long system of stone quays which completely surrounded the island had been turned into parks which proved a god-send to the population. The subsidizing of the state theatre and state opera brought its own reward. The United States National Academy of Design was much like European institutions of the same kind. Nobody envied the Secretary of Fine Arts, either his cabinet position or his portfolio. The Secretary of Forestry and Game Preservation had a much easier time, thanks to the new system of National Mounted Police. We had profited well by the latest treaties with France and England; the exclusion of foreign-born Jews as a measure of self-preservation, the settlement of the new independent negro state of Suanee, the checking of immigration, the new laws concerning naturalization, and the gradual centralization of power in the executive all contributed to national calm and prosperity. When the Government solved the Indian problem and squadrons of Indian cavalry scouts in native costume were substituted for the pitiable organizations tacked on to the tail of skeletonized regiments by a former Secretary of War, the nation drew a long sigh of relief. When, after the colossal Congress of Religions, bigotry and intolerance were laid in their graves and kindness and charity began to draw warring sects together, many thought the millennium had arrived, at least in the new world which after all is a world by itself.

"To my mind, every man should devote at least some small attention to Weight-lifting. I don't think that I have come to this conclusion simply because I myself have gained some distinction as a weight-lifter, but rather for the reasons set forth below. First of all, why does a man learn to box? Well, because it is asserted that every man should learn how to defend himself in case of necessity. A good and sufficient reason, you will say. The same may also be put forward as an excuse for learning wrestling and ju-jitsu no doubt, but I am inclined to fancy that the noble art would possibly be more useful than either. As to fencing, club-swinging, etc., I know no reason for their practice except it be that of pleasure or a desire for physical exercise, which said reasons may be equally advanced for Weight-lifting, which it will, I think, be further readily admitted is the most sure and certain means of developing strength—a quality which would be most undeniably useful in any means of self-defence. Now, beside all this, every man in every walk of life is certain, sooner or later, to be confronted with a heavy object, bulky or otherwise, which he strongly desires to lift". - Arthur Saxon This is an original version, restored and re-formatted edition of Saxon's 1910 classic. There are number of books on Vector Dynamics in the market for the use of degree students in various universities in India. It is the experience of author that the average students need the treatment of theory in a way that should be easily comprehensive to him. Therefore an effort has been made in this book to put the matter in a very lucid and simple way to that even a beginner has no difficulty in grasping the subject. Each chapter for this book contains complete theory and a fairly large number of solved examples sufficient problems have also been selected from various university examinations paper. At the end of each chapter an exercise containing objective questions only has been given. The answer to almost all unsolved problems have been checked and every care has been taken to avoid printing and other mistakes. It is sincerely hoped that this book will satisfy the needs of the students and if it gives them even part of pleasure that the author had in its preparations he will consider his labour amply rewarded. Book, Text, Medium: Cross Sectional Reading for a Digital Age utilizes codex history, close reading, and language philosophy to assess the transformative arc between medieval books and today's e-books. It examines what happens to the reading experience in the twenty-first century when the original concept of a book is still held in the mind of a reader, if no longer in the reader's hand. Leading critic Garrett Stewart explores the play of mediation more generally, as the concept of book moves from a manufactured object to simply the language it puts into circulation. Framed by digital poetics, phonorobotics, and the rising popularity of audiobooks, this study sheds new light on both the history of reading and the negation of legible print in conceptual book art.

Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.

Designed for literature-based writing courses, Text Book introduces students to the idea that literary texts and ordinary spoken and written language share many of the same features. By providing imaginative methods and unique assignments that let students work with those features in their writing, Text Book involves students in the processes of exploring literature creatively, not simply consuming and analyzing it, helping them understand literature "from the inside out."

This book is written for use in the class room. It may, however, be studied just as easily by the field practitioner, and is not too technical in most of its parts to be readily grasped by the layman. It has grown, rather than having been written; it is the expansion of the notes which were tested in the class room for six years, and the writer believes that, with the constant arrangement and betterment to suit the requirements of the students of Chiropractic, this has created a real textbook, rendering easily understood a subject that students have always said was difficult.

This book has been considered by academicians and scholars of great significance and value to literature. This forms a part of the knowledge base for future generations. So that the book is never forgotten we have represented this book in a print format as the same form as it was originally first published. Hence any marks or annotations seen are left intentionally to preserve its true nature.
