The text of this book contains brief explanations on the rules and regulations on occupational safety and health (OSH), as expressed in Occupational Safety and Health Act (OSHA) 1994 and Factories and Machinery Act (FMA) 1967. The text is divided into 10 modules, beginning with a module on selected issues in OSH, then on the duties of various categories of person, safety, health, welfare, training, enforcement, notification procedures, emergency preparations, and guides to OSH management. Instructions and directives arising from the issues are laid out with supporting legislative provisions. The book is written in simple non-technical and non-legalistic fashion and without lengthy discussions on any topic. The use of English enables readers to find the right flavour in reading the rules and regulations.

Distilling the ideas central to managing operating theatres, this book provides a practical and easy to use toolkit to improve theatre efficiency and patient outcomes. It advocates using time as the key measurement and proposes a new norm of operating theatre management based on rational, data-driven principles. Notions of 'efficiency' and 'scheduling' are clearly defined, and a scheduling toolkit available to download accompanies the work. The book's easy to use format supports managers in list planning, performance monitoring and demand-capacity matching while considering limited budgets and resources. It includes contributions from around the world, demonstrating the global application of its core approach. Aimed primarily at operating theatre managers, this book will also interest consultants, senior trainees, nurses and administrators who are involved in the daily running of the operating theatre and/or want to develop their leadership/managerial skills.

Causes of injuries are explored. Injuries are also analyzed on the basis of intent. Injuries are illustrated by age, race, sex, geographic area, urban/rural residence, and per capita income.

Megaprojects and Risk provides the first detailed examination of the phenomenon of megaprojects. It is a fascinating account of how the promoters of multi-billion dollar megaprojects systematically and self-servingly misinform parliaments, the public and the media in order to get projects approved and built. It shows, in unusual depth, how the formula for approval is an unhealthy cocktail of underestimated costs, overestimated revenues, undervalued environmental impacts and overvalued economic development effects. This results in projects that are extremely risky, but where the risk is concealed from MPs, taxpayers and investors. The authors not only explore the problems but also suggest practical solutions drawing on theory, experience and hard, scientific evidence from the several hundred projects in twenty nations and five continents that illustrate the book. Accessibly written, it will be the standard reference for students, scholars, planners, economists, auditors, politicians and interested citizens for many years to come.

This A to Z encyclopedia provides a comprehensive, definitive, and up-to-date reference of the main areas of specialist and expert knowledge and skills used by those involved in all aspects of the forensic process, including, but not limited to, forensic scientists, doctors, practicing and academic lawyers, paralegals, police, crime scene investigators, analytical chemists, behavioral scientists and toxicologists. This five-volume set covers all topics which, either as part of an established forensic discipline or as a potentially useful emerging discipline, are of interest to those involved in the forensic process. This includes both the scientific methodology and the admissibility of evidence. The encyclopedia also provides case studies of landmark cases in the definition and practice of forensic science. Wiley Encyclopedia of Forensic Science presents all material on a level and in a style that makes it accessible to a wide range of readers. In particular, lawyers needing to better understand the key aspects of the science, and scientists who require a deeper insight into legal issues will find the encyclopedia an important resource, as will physical, biological and behavioral scientists who require background information on the most important aspects of each other's areas of expertise.

"Child injuries have been neglected for many years, and are largely absent from child survival initiatives presently on the global agenda. Through this World report on child injury prevention, the World Health Organization, the United Nations Children's Fund and many partners have set out to elevate child injury to a priority for the global public health and development communities. The knowledge and experience of nearly two hundred experts from all continents and various sectors were invaluable in grounding the report in the realities faced in many countries. This World report on child injury prevention should be seen as a complement to the UN Secretary-General's study on violence against children released in late 2006. That report addressed violence-related or intentional injuries. Both reports suggest that child injury and violence prevention programmes need to be integrated into child survival and other broad strategies focused on improving the lives of children. Evidence demonstrates the dramatic successes in child injury prevention in countries which have made a concerted effort. These results make a case for increasing investments in human resources and institutional capacities. This would permit the development, implementation and evaluation of programmes to stem the tide of child injury and enhance the health and well-being of children and their families the world over. Implementing proven interventions could save more than a thousand children's lives a day." - p. vii.

First published in 1968, Jacob Feld's Construction Failure has long been considered the classic text on the subject. Retaining all of the key components of Feld's comprehensive exploration of the root causes of failure, this Second Edition addresses a multitude of important industry developments to bring this landmark work up to date for a new generation of engineers, architects, and students. In addition to detailed coverage of current design tools, techniques, materials, and construction methods, Construction Failure, Second Edition features an entire chapter on the burgeoning area of construction litigation, including a thorough examination of alternative dispute resolution techniques. Like the original, this edition discusses technical and procedural failures of many different types of structures, but is now supplemented with new case studies to illustrate the dynamics of failure in action today. Jacob Feld knew thirty years ago that in order to learn from our mistakes, we must first acknowledge and understand them. With this revised volume, Kenneth Carper has ensured that Feld's now-posthumous message will continue to be heard for years to come. Jacob Feld's comprehensive work on failure analysis has now been skillfully amended to address current design and construction tools, materials, and practices. Building on the first edition's peerless examination of the causes and lessons of failure, Construction Failure, Second Edition provides you with expanded coverage of: \* Technical, procedural, structural, and nonstructural failures \* Natural hazards, earthworks, soil and foundation problems, and more \* Reinforced, precast and prestressed concrete, steel, timber, masonry, and other materials \* Responsibility and litigation concerns, dispute avoidance, and alternative dispute resolution techniques \* Construction safety issues \* Many different types of structures, including dams and bridges Construction Failure has as much to teach us today as it did thirty years ago. This revised volume is an essential resource for design engineers, architects, construction managers, lawyers, and students in all of these fields. This manual is aimed at helping medical record workers in the development and management of medical records services of health care facilities in developing countries in an effective and efficient manner. It has not been designed as an introductory text to medical record management, but rather as an aid to medical record officers (MROs) and medical record clerks by describing appropriate systems for Medical Records Departments in developing countries. It covers manual procedures and may be used as an adjunct to computerized systems. It does not provide all of the options for medical record management, but it does provide one option in each area for the management of medical records in developing countries. A list of the textbooks that provide detailed information on medical record management is also provided.

This book has 18 case study chapters investigating various injury scenarios through the use of a Human Factors and Ergonomics (HFE) analysis. Each injury scenario derives from one or more similar lawsuits (but names, places and some of the details are fictionalized). The scenarios describe a 'slice of life' of people interacting with products, equipment, tasks, and environments before they are seriously hurt. The forensic analyses that follows each scenario gives a background of prior similar events and systematically examines potential causes leading up the injury event, with emphasis on the person-machine interface, human error, hazard analysis, hazard control and a model of communication-human information processing (C-HIP). Chapter authors are highly experienced expert witnesses in HFE. The methods used are general techniques that can be applied to other injury scenarios, but would be better if employed earlier in a product's life cycle to prevent or limit injury. The last chapter offers some broad take-away points that cut across several of the case studies.
