"Marvelous. . . . A wonderful book."--Humana.Mente "Rovelli is the dream author to conduct us on this

journey."--Nonfiction.fr "At this point in time, when the prestige of science is at a low and even simple issues like climate change are mired in controversy, Carlo Rovelli gives us a necessary reflection on what science is, and where it comes from. Rovelli is a deeply original thinker, so it is not surprising that he has novel views on the important questions of the nature and origin of science."--Lee Smolin, founding

member and researcher at the Perimeter Institute for Theoretical Physics and author of *The Trouble with Physics*

Winner of the Prix du Livre Haute Maurienne de l'Astronomie Carlo Rovelli, a leading theoretical physicist, uses the figure of Anaximander as the starting point for an examination of

scientific thinking itself: its limits, its strengths, its benefits to humankind, and its controversial relationship with religion. Anaximander, the sixth-century BC Greek philosopher, is

often called the first scientist because he was the first to suggest that order in the world was due to natural forces, not supernatural ones. He is the first person known to understand

that the Earth floats in space; to believe that the sun, the moon, and the stars rotate around it--seven centuries before Ptolemy; to argue that all animals came from the sea and evolved; and to posit that universal laws control all change in the world. Anaximander taught Pythagoras, who would build on Anaximander's scientific theories by applying mathematical laws to natural phenomena. In the award-winning *The First Scientist: Anaximander and His Legacy*, translated here for the first time in English, Rovelli restores Anaximander to his place in the history of science by carefully reconstructing his theories from what is known to us and examining them in their historical and philosophical contexts. Rovelli demonstrates that Anaximander's discoveries and theories were decisive influences, putting Western culture on its path toward a scientific revolution. Developing this connection, Rovelli redefines science as a continuous redrawing of our conceptual image of the world. He concludes that scientific thinking--the legacy of Anaximander--is only reliable when it constantly tests the limits of our current knowledge.

components of the series are endorsed by Cambridge International Examinations. This Biology Workbook is tailored to the Cambridge IGCSE® Combined Science 0653 and Co-ordinated Sciences 0654 syllabuses for first examination in 2019 and is endorsed for learner support by Cambridge International Examinations. Covering both the Core and the Supplement material, this workbook contains exercises arranged in the same order as the coursebook and are clearly marked according to the syllabus they cover. Developing students' scientific skills, these exercises are complemented by self-assessment checklists to help them evaluate their work as they go. Answers are provided at the back of the book.

The purpose of the volume is to provide a support for a first course in Mathematics. The contents are organised to appeal especially to Engineering, Physics and Computer Science students, all areas in which mathematical tools play a crucial role. Basic notions and methods of differential and integral calculus for functions of one real variable are presented in a manner that elicits critical reading and prompts a hands-on approach to concrete applications. The layout has a specifically-designed modular nature, allowing the instructor to make flexible didactical choices when planning an introductory lecture course. The book may in fact be employed at three levels of depth. At the elementary

level the student is supposed to grasp the very essential ideas and familiarise with the corresponding key techniques. Proofs to the main results befit the intermediate level, together with several remarks and complementary notes enhancing the treatise. The last, and farthest-reaching, level requires the additional study of the material contained in the appendices, which enable the strongly motivated reader to explore further into the subject. Definitions and properties are furnished with substantial examples to stimulate the learning process. Over 350 solved exercises complete the text, at least half of which guide the reader to the solution. This new edition features additional material with the aim of matching the widest range of educational choices for a first course of Mathematics.

Bringing a lively and accessible style to a complex subject, "Cyborgs and Barbie Dolls" explores the idea of the 'posthuman' and the ways in which it is represented in popular culture. Toffoletti explores images of the posthuman body from goth-rocker Marilyn Manson's digitally manipulated self-portraits to the famous TDK 'baby' adverts, and from the work of artist Patricia Piccinini to the curiously 'plastic' form of the ubiquitous Barbie doll, controversially rescued here from her negative image. Drawing on the work of thinkers including Baudrillard, Donna Haraway and Rosi Braidotti, "Cyborgs and Barbie Dolls" explores the nature of the human - and its ambiguous gender - in an age of biotechnologies and digital worlds.

Fifty years ago, James D. Watson, then just twentyfour, helped launch the greatest ongoing scientific quest of our time. Now, with unique authority and sweeping vision, he gives us the first full account of the genetic revolution—from Mendel's

garden to the double helix to the sequencing of the human genome and beyond. Watson's lively, panoramic narrative begins with the fanciful speculations of the ancients as to why "like begets like" before skipping ahead to 1866, when an Austrian monk named Gregor Mendel first deduced the basic laws of inheritance. But genetics as we recognize it today—with its capacity, both thrilling and sobering, to manipulate the very essence of living things—came into being only with the rise of molecular investigations culminating in the breakthrough discovery of the structure of DNA, for which Watson shared a Nobel prize in 1962. In the DNA molecule's graceful curves was the key to a whole new science. Having shown that the secret of life is chemical, modern genetics has set mankind off on a journey unimaginable just a few decades ago. Watson provides the general reader with clear explanations of molecular processes and emerging technologies. He shows us how DNA continues to alter our understanding of human origins, and of our identities as groups and as individuals. And with the insight of one who has remained close to every advance in research since the double helix, he reveals how genetics has unleashed a wealth of possibilities to alter the human condition—from genetically modified foods to genetically modified babies—and transformed itself from a domain of pure research into one of big business as well. It is a

sometimes topsy-turvy world full of great minds and great egos, driven by ambitions to improve the human condition as well as to improve investment portfolios, a world vividly captured in these pages. Facing a future of choices and social and ethical implications of which we dare not remain uninformed, we could have no better guide than James Watson, who leads us with the same bravura storytelling that made *The Double Helix* one of the most successful books on science ever published. Infused with a scientist's awe at nature's marvels and a humanist's profound sympathies, DNA is destined to become the classic telling of the defining scientific saga of our age.

The existence of a new family of chemotactic cytokines was realised in 1987 following the isolation and structural determination by several groups of a peptide consisting of 72 amino acids which was a potent activator of neutrophils and a chemotactic agent for lymphocytes. The first symposium of this series was held at the Royal College of Surgeons of England in December 1988, entitled *Novel Neutrophil Stimulating Peptides*, and brought together the majority of the laboratories which had published in this area, see *Immunology Today* 10: 146-147(1989). Since the first symposium there has been a dramatic increase in our knowledge of the biology of this family of structurally related peptides. The Second International Symposium on

Chemotactic Cytokines was held at the Royal College of Surgeons of England in June 1990. The aim of this symposium was to provide both a forum for discussion and to determine whether this knowledge can be utilised in the design of novel therapeutic strategies for the treatment of inflammatory disorders. Although the majority of studies have been concerned with the regulation of these peptides at the molecular and cellular level, there is now evidence to suggest that specific members of this superfamily have a role in the pathogenesis of a number of diverse diseases including arthritis, psoriasis, atherosclerosis, wound repair, inflammatory lung diseases and glomerulonephritis.

At the age of 61, Cassandra, a single and peripatetic Brit, was asked to pack up her house and move to Italy to take up the offer of a much-needed job. 15 months later she was made redundant, leaving her unnerved, broke and unable to return home. Her dream of a new life was rapidly turning into a nightmare and, saddled with all her belongings, her antique furniture, over 800 books and her aged Siamese cat she had nowhere to go. A kind friend offered them sanctuary in a tiny converted former barn in his family's 'Borgo', a cluster of rustic properties grouped around a late-Medieval manor House in the mountains; the beautiful and mysterious Emilian Appenines of northern Italy. There she was befriended and watched over by the owner; an eccentric octogenarian, his household ghosts and 14 semi feral

cats. The experience proved to be challenging yet deeply transformative as she struggled to recover her equilibrium and rebuild her life.
