Revised edition of: Campbell biology in focus / Lisa A. Urry, Michael L. Cain, Steven A. Wasserman, Peter V. Minorsky, Jane B. Reece. Second edition. [2016].

Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for

many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.

Rev. ed. of: Media and culture. 2nd ed. c2000. Includes bibliographical references (p. 575-582) and index.

Basic Optics: Principles and Concepts addresses in great detail the basic principles of the science of optics, and their related concepts. The book provides a lucid and coherent presentation of an extensive range of concepts from the field of optics, which is of central relevance to several broad areas of science, including physics, chemistry, and biology. With its

extensive range of discourse, the book's content arms scientists and students with knowledge of the essential concepts of classical and modern optics. It can be used as a reference book and also as a supplementary text by students at college and university levels and will, at the same time, be of considerable use to researchers and teachers. The book is composed of nine chapters and includes a great deal of material not covered in many of the more well-known textbooks on the subject. The science of optics has undergone major changes in the last fifty years because of developments in the areas of the optics of metamaterials, Fourier optics, statistical optics, quantum optics, and nonlinear optics, all of which find their place in this book, with a clear presentation of their basic principles. Even the more traditional areas of ray optics and wave optics are elaborated within the framework of electromagnetic theory, at a level more fundamental than what one finds in many of the currently available textbooks. Thus, the eikonal approximation leading to ray optics, the Lagrangian and Hamiltonian formulations of ray optics, the quantum theoretic interpretation of interference, the vector and dyadic diffraction theories, the geometrical theory of diffraction, and similar other topics of basic relevance are presented in clear terms. The presentation is lucid and elegant, capturing the essential magic and charm of physics. All this taken together makes the book a unique text, of major contemporary relevance, in the field of optics. Avijit Lahiri is a well-known researcher, teacher, and author, with publications in several areas of physics, and with a broad range of current interests, including physics and the philosophy of science. Provides extensive and thoroughly exhaustive coverage of classical and modern optics Offers a lucid presentation in understandable language, rendering the abstract and difficult concepts of physics in an easy, accessible way Develops all concepts from elementary levels to advanced stages Includes a sequential description of all needed mathematical tools Relates fundamental concepts to areas of current research interest

A collection of papers that document various dimensions of the ways in which the language learner and the language proficiency interviewer use language to accomplish oral language assessment tasks.

No account is more critical to our understanding of Joan of Arc than the contemporary record of her trial in 1431.

Convened at Rouen and directed by bishop Pierre Cauchon, the trial culminated in Joan's public execution for heresy.

The trial record, which sometimes preserves Joan's very words, unveils her life, character, visions, and motives in fascinating detail. Here is one of our richest sources for the life of a medieval woman. This new translation, the first in fifty years, is based on the full record of the trial proceedings in Latin. Recent scholarship dates this text to the year of the trial itself, thereby lending it a greater claim to authority than had traditionally been assumed. Contemporary documents copied into the trial furnish a guide to political developments in Joan's career—from her capture to the attempts to control public opinion following her execution. Daniel Hobbins sets the trial in its legal and historical context. In exploring Joan's place in fifteenth-century society, he suggests that her claims to divine revelation conformed to a recognizable profile of holy women in her culture, yet Joan broke this mold by embracing a military lifestyle. By combining the roles of visionary

and of military leader, Joan astonished contemporaries and still fascinates us today. Obscured by the passing of centuries and distorted by the lens of modern cinema, the story of the historical Joan of Arc comes vividly to life once again.
