This book explores ways in which libraries can reach new levels of service, quality, and efficiency while minimizing cost by collaborating in acquisitions. In consortial acquisitions, a number of libraries work together, usually in an existing library consortia, to leverage size to support acquisitions in each individual library. In cross-functional acquisitions, acquisitions collaborates to support other library functions. For the library acquisitions manager, technical services manager, or the library director, awareness of different options for effective consortial and cross-functional acquisitions allows for the optimization of staff and resources to reach goals. This work presents those options in the form of case studies as well as useful analysis

of the benefits and challenges of each. By supporting each other's acquisitions services in a consortium, libraries leverage size to get better prices, and share systems and expertise to maximize resources while minimizing costs. Within libraries, the acquisitions function can be combined with other library functions in a unit with more than one purpose, or acquisitions can develop a close working relationship with another unit to support their work. This book surveys practice at different libraries and at different library consortia, and presents a detailed description and analysis of a variety of practices for how acquisitions units support each other within a consortium, and how they work with other library units, specifically collection management, cataloging, interlibrary loan, and the digital repository, in the form of case studies. A final section of the book covers fundamentals of collaboration.

In his essential writing guide, *This Year You Write Your Novel*, Walter Mosley supplied aspiring writers with the basic tools to write a novel in one year. In this complementary follow up, Mosley guides the writer through the elements of not just any fiction writing, but the kind of writing that transcends convention and truly stands out. How does one approach the genius of writers like Melville, Dickens, or Twain? In *The Elements of Fiction Writing*, Walter Mosley contemplates the answer. In a series of instructive and conversational chapters, Mosley demonstrates how to master fiction's most essential elements: character and character development, plot and story, voice and narrative, context and description, and more. The result is a vivid depiction of the writing process, from the blank page to the first draft to rewriting, and rewriting again. Throughout, *The Elements of Fiction Writing* is enriched by brilliant demonstrative examples that Mosley himself has written here for the first time. Inspiring, accessible, and told in a voice both trustworthy and wise, *The Elements of Fiction writing* will intrigue and encourage writers

and readers alike.

Building upon the previous editions, this textbook is a first course in stochastic processes taken by undergraduate and graduate students (MS and PhD students from math, statistics, economics, computer science, engineering, and finance departments) who have had a course in probability theory. It covers Markov chains in discrete and continuous time, Poisson processes, renewal processes, martingales, and option pricing. One can only learn a subject by seeing it in action, so there are a large number of examples and more than 300 carefully chosen exercises to deepen the reader's understanding. Drawing from teaching experience and student feedback, there are many new examples and problems with solutions that use TI-83 to eliminate the tedious details of solving linear equations by hand, and the collection of exercises is much improved, with many more biological examples. Originally included in previous editions, material too advanced for this first course in stochastic processes has been eliminated while treatment of other topics useful for applications has been expanded. In addition, the ordering of topics has been improved; for example, the difficult subject of martingales is delayed until its usefulness can be applied in the treatment of mathematical finance.
