Radio Frequency Identification (RFID) is a key technology in the food industry that facilitates real-time visibility of items as they move through the supply chain and on to the end-consumer. Among all the currently available automatic identification technologies, RFID has clear dominance in terms of its ability to support real-time two-way communication, data storage and update, authentication, ambient condition sense and report, batch read without direct line-of-sight, operation in harsh environments and sensor-based applications. RFID and Sensor Network Automation in the Food Industry provides sufficient detail on the use of RFID and sensor networks from 'farm to fork' (F2F) to allow the reader to appreciate the myriad possible applications of RFID and associated sensor network systems throughout the entire food supply chain. This includes precision agriculture, the provision of seamless visibility in track and trace applications, reduction of wastage, identification of counterfeits and contamination sources, remaining shelf-life applications for perishables, and quality and safety measures, among others. Providing state-of-the-art information from peer-reviewed research publications as well as general industry trends, this book will be of interest to all stakeholders in the agri-food supply chain, and academics and advanced students with an interest in these fields.

Massive technological change has been impacting universities and university libraries in recent years. Such change has manifested in technological developments impacting all areas of academic library activity, including systems, services, collections, the physical library environment, marketing, and support for university teaching, learning, research, and administration. Many books and papers have examined these changes from a technical perspective. However, there is little substantive reflection on what technological change means, and how best to get out in front of it, for the academic library. *Technology, Change and the Academic Library* systematically reflects on technological innovation, the successes, failures and lessons learned, the nature, process and culture of change, and key aspects including impacts on library staff and users, roles and responsibilities, and skills and capabilities. The book takes an international

perspective on the massive change currently affecting academic libraries. The title gives an overview and literature review, considers technological innovation and change management, future technologies and future change, and provides information on further reading. Case studies describe the rationale, aims, and objectives for particular technological innovations, and consider methods, outcomes, and recommendations for the future. Finally, the book reflects back on how technological change can best be wrought in academic libraries. Gives library managers and librarians insight into how best to identify, plan, and implement technological innovation Provides a wide-ranging overview, literature review, and a series of reflective case studies on technological innovation in libraries Emphasises current trends, lessons, and critical issues for putting technological innovation into place Offers an international perspective on technological innovation in the academic library Uses a critical methodology to reflect on what works, what does not, and how managers can apply lessons from real cases worldwide

Data Access and Storage Management for Embedded Programmable Processors gives an overview of the state-of-the-art in system-level data access and storage management for embedded programmable processors. The targeted application domain covers complex embedded real-time multi-media and communication applications. Many of these applications are data-dominated in the sense that their cost related aspects, namely power consumption and footprint are heavily influenced (if not dominated) by the data access and storage aspects. The material is mainly based on research at IMEC in this area in the period 1996-2001. In order to deal with the stringent timing requirements and the data dominated characteristics of this domain, we have adopted a target architecture style that is compatible with modern embedded processors, and we have developed a systematic step-wise methodology to make the exploration and optimization of such applications feasible in a source-to-source precompilation approach.

With increased globalization and offshore sourcing, global supply chain management is becoming an important issue for many businesses as it involves a company's worldwide interests and suppliers rather than simply a local or national orientation. The storage systems significantly affect the level of quality of products, the customer's service level, and the global logistic cost. The mission of warehousing systems design, control and optimization is to effectively ship products in the right place, at the right time, and in the right quantity (i.e. in any configuration) without any damages or alterations, and minimizing costs. Warehousing in the Global Supply Chain presents and discusses a set of models, tools and real applications, including a few case studies rarely presented with a sufficient detail by other literature, to illustrate the main challenges in warehousing activities. This includes all warehouse operations (from receiving to shipping), problems and issues (e.g. storage allocation, assignment, layout, vehicle routing) for industrial and service systems as parts of global supply chains. Advanced and effective solving methods are also illustrated and the discussed case studies help the reader to quickly apply the proposed models and techniques/algorithms. Warehousing in the Global Supply Chain is useful to managers and practitioners of industry and service sectors for the determination and modeling of the critical issues concerning warehousing systems planning and design. It is a valuable source of information for engineering students, doctoral and post-doctoral students, and researchers of academic institutions who are searching for advanced modeling approaches and solving techniques to complex logistic decision making problems.
