Chemistry: Imagination and Implication focuses on the importance and impact of chemistry on daily living. This book discusses the essential concepts of chemistry and its application.

Organized into 16 chapters, this book starts with an overview of the experimental facts, principles, and methods of chemistry as an aid in exercising intelligent and informed judgment in instances where controversy surrounds the interaction of chemistry with society or the individual. This text then explores the practical arts of metallurgy, which achieved a considerable degree of sophistication long before they were scientifically understood. The reader is then introduced to the atomic concept, the conservation of mass, as well as to the substances that constitute the living things. Other chapters consider the polymerization of amino acids into peptides and proteins. The final chapter examines the various applications of radioactive isotopes produced in particle accelerators. This book is intended for students and teachers who are involved in a chemistry course.

For the first time in over twenty-five years, this unique and popular textbook on food chemistry mechanism and theory has received a full update. Emphasizing the underlying chemical reactions and interactions that occur in foods during processing and storage, this book unifies the themes of "what", "how" and "why" in the language of equations, reactions and mechanisms. This book is the only work which provides in-depth focus on aspects of reaction mechanisms and theories in the chemistry of food and food systems. With more than 500 chemical equations and figures, this book provides unusual clarity and relevance, and fills a significant gap in food chemistry literature. It is a definitive source to consult regarding the important mechanisms that make food components and reactions tick. Mechanism and Theory in Food Chemistry has been a popular resource for students and researchers alike since its publication in 1989. This important new edition contains updates on the original text encompassing a quarter century of advances in food chemistry. Many parts of the original chapters are revised to make for smoother navigation through the subjects, to better explain the underlying chemistry concepts and to fulfill the need of adding topics of emerging importance. New sections on fatty acids, lipid

oxidation, meat, milk, soybean and wheat proteins, starch and many more have been incorporated throughout the revision. This updated edition provides an excellent source of all the important chemical mechanisms and theories involved with food science.

There is no need in the 1970s to explain the writing of a book on "Environmental Chemistry." The despoliation of the environment by man's activities has long been clear to chemists. However, it has been the subject of public debate for a short time--since the late 1960s. Curiously, there has been little reaction in the textbook literature to reflect this concern. Apart from some brief and sketchy paperbacks for schools, there has not yet been published a substantial review of environmental chemistry. One reason for this is the breadth of the chemistry involved: it could scarcely be covered by one or two authors, for it is as wide as chemistry itself. The ideal way to write such a book would be to gather a couple of dozen authors in one place and keep them together for 6 months of discussions and writing. This not being very practical, it was decided to do the next best thing and to attempt to network a number of men together in mutual correspondence and interaction, which would lead to a book that had the advantages of the expertise of a large number of persons, and lacked many of the usual disadvantages of the multi author book. Thus, synopses of the various articles were sent to each author, and they were encouraged to interact with each other in attempting to avoid repetition and in keeping their symbols uniform and their presentation style coordinated.
