engineers involved with the design of magnetic devices for motion control and other instrumentation that uses magnetic principles and technology. It can be of benefit to graduate and postgraduate students to gain experience with electro-magnetic principles and also with different aspects of magnetic coupling mechanisms and magnetic circuitry analysis for the design of devices such as electrical servo motors, tachogenerators, encoders, gyro magnetic suspension systems, electro-magnetic strip lines, and other electro-magnetic instruments. The rapidly growing areas of production automation, robotics, precise micro-electronics, and pilot navigation place demands on motion control technology in terms of accuracy, reliability, cost effectiveness, and miniaturization. New ferromagnetic materials having quasi-linear and non-linear high-squareness characteristics as well as high-energy permanent magnets, fine lithography, and high-temperature superconductivity (to be expected commercially) motivate the implementation of new motion control components that exploit these new materials and technologies. This book presents classical miniature electrical machine designs as well as several modifications in the geometry of magnetic couplings which lead to new motor and encoder design methodologies and other motion control devices such as new coil deposition patterns for incremental and absolute encoders, free spherical gyro suspension in a traveling magnetic field for navigation instrumentation, and magnetic strip lines in combination with resistive and capacitive media to generate a variety of low-noise LC filters and other signal processing devices.
