The field of professional, academic and vocational qualifications is ever-changing. The new edition of this practical guide provides thorough information on all developments in these areas in the UK. Fully indexed, it includes details on all university awards and over 200 career fields, their professional and accrediting bodies, levels of membership and qualifications. British Qualifications is a unique resource for human resource managers and university admissions officers to verify the qualifications of potential employees and students.

Basic Principles of Electronics, Volume I: Thermionics covers topics related to thermionic devices. The book starts by providing a physical background about electronics, including structure of matter, ionic, chemical and covalent combination, crystalline structure, conductors and insulators, and thermionic emission. The text then discusses electron dynamics; the characteristics and properties of electrons in solids; electron emission; and thermionic emission in a vacuum diode or triode. The development of the vacuum triode; gas-filled valves; and power amplifiers are also considered. The book further tackles oscillators intended to give a sinusoidal output as well as electronic measuring equipment. Students taking electronics for physics courses will find the book useful.

The Get Qualified series provides clear and concise guidance for people looking to work within the electrical industry. This book outlines why the inspection and testing of electrical installations is important, and what qualifications are required in order to test, inspect and certify. All you need to know about the subject of inspection is covered in detail, making this book the ideal guide for those who are new to the subject and experienced professionals alike. There are also sections on exam preparation, revision exercises and sample questions.

This book examines women's activism in the early years of independent Indonesia when new attitudes to gender, nationalism, citizenship and democratization were forming. It questions the meaning of democratization for women and their relationship to national sovereignty within the new Indonesian state, and discusses women's organizations and their activities; women's social and economic roles; and the different cultural, regional and ethnic attitudes towards women, while showing the failure of political change to fully address women's gender interests and needs. The author argues that both the role of nationalism in defining gender identity and the role of gender in defining national identity need equal recognition.

This is the first title in this new series, which is aimed principally at secondary PGCE and BAEd students and school- and HEI-based tutors. Each book provides a digest of the central issues around a particular topic or issues, grounded in or supported by examples of good practice, with suggestions for further reading, study and investigation. The books are not intended as 'how to' books, but rather as books which will help students and teachers to explore and understand critical theoretical issues in ways that are challenging, that invite critical reappraisals of taken-for-granted practices and perceptions, and that provide appropriate links between theory and practice. Issues related to equal opportunities and special needs are included in each separate volume.

There are boxes of questions, 'think abouts', further reading, and bulleted summary lists for the reader. This book is written specifically for teachers-in-training which will clarify the 'big picture' of monitoring and assessment and makes the crucial distinctions in this large (and still taken-for-granted) field. The authors have written widely on assessment matters and have also worked in various capacities for the QCA (and its former manifestations). They are also engaged in initial teacher education and so know the level and market extremely well.

Electronics for Technicians covers the basic fundamentals of electronics, including the operation of devices and circuits. The book is meant to help the technician to obtain numerical answers to actual circuit problems. This volume consists of seven chapters, the first of which introduces the reader to the basic rules for circuits containing resistive and reactive elements. Charge and discharge of a capacitor through a resistor is discussed, along with charge and discharge of an inductance through a resistance, application of sinusoidal voltages to simple networks, and series and parallel LCR circuits. The chapters that follow focus on the simple construction and operation of vacuum and semiconductor rectifier devices capable of amplifying alternating signals, uses of transistors and valves in amplifier circuits, and power supplies. Negative and positive feedback is also considered, with particular emphasis on circuit descriptions of the more common oscillator types that produce or do not produce sinusoidal waves. The book concludes with a chapter on laboratory test equipment such as cathode-ray oscilloscopes, alternating current electronic voltmeters, low-frequency signal generators, and Q-meters. This book is written specifically for technicians in the electrical engineering industry.

This book is designed to give parents and teachers information on the alternative education options available in the UK. It covers three main areas: Outside the state system: small schools; Steiner Waldorf schools; Montessori schools; democratic schools and other schools with alternative philosophies Doing it yourself: setting up a small school or learning centre; educating at home; flexible schooling Alternatives within the state system: how some state schools are finding different ways of working The values, philosophies and methods of each alternative are described, including the first-hand experiences and accounts of children, teachers and parents. There are answers to common questions and useful sources of further information. This accessible and informative book is the ideal introduction for parents deciding how best to educate their children. It will be of interest to teachers looking to build their knowledge of different education philosophies.

Brickwork is a form of masonry that utilises bricks and mortar. Rows of bricks—or, 'courses'—are placed on top of each other in order to create a structure such as a wall. This is volume I of William Frost's "The Modern Bricklayer", a detailed guide to all aspects of bricklaying, including slating, tiling, planning, materials, tools, and more. Contents include: "House Drains", "Egg-Shaped and Circular Sewers", "Sand Courses", "Retaining Walls", "Reinforced Brickwork", "Arches", "Cornices", "Gauged Brickwork: Introduction", "Gauged Work—Various Forms of Arches", "Gauges Work—Arches", "Gauged Work: Nitches, Panels, and Mouldings", "Terra-cotta and Glazed Ware", etc. Many vintage books such as this are becoming increasingly scarce and expensive. It is with this in mind that we are republishing this volume now in a modern, high-quality edition complete with a specially-commissioned new introduction on DIY.

New Scientist magazine was launched in 1956 "for all those men and women who are interested in scientific discovery, and in its industrial, commercial and social consequences". The brand's mission is no different today - for its consumers, New Scientist reports, explores and interprets the results of human endeavour set in the context of society and culture.

Electrical Installations Technology covers the syllabus of the City and Guilds of London Institute course No. 51, the "Electricians B Certificate". This book is composed of 15 chapters that deal with basic electrical science and electrical installations. The introductory chapters discuss the fundamentals and basic electrical principles, including the concept of mechanics, heat, magnetic fields, electric currents, power, and energy. These chapters also explore the atomic theory of electric current and the electric circuit, conductors, and insulators. The subsequent chapter focuses on the chemistry of

an electric cell, which is classified into two types, namely, the primary and secondary cells. This text also describes the principles, construction, types, and specifications of direct current machines. A chapter emphasizes the storage of energy for short periods in a capacitor, along with a brief discussion of its theory and construction. Other chapters are devoted to alternating-current systems. The remaining chapters cover the commonly used electrical measuring instruments in electrical installation work. This book is an invaluable source for electricians.

Instrument Technology, Volume 3: Telemetry and Automatic Control deals with advances in telemetry instruments used in automatic control of industrial processes. The focus is on instruments used to transmit to a control room an indication of the value of a measured variable, and on instruments and mechanisms used to control process variables. The basic physical principles are discussed and the actual instruments are classified according to the principle upon which they are based. This volume consists of two chapters and begins with an overview of telemetry and pneumatic methods of telemetry. Electrical telemetry systems are described in terms of telemetry by variation of an electrical quantity, balanced bridge systems, and position systems. The second chapter discusses the theory of automatic control and illustrates the automation of temperature control in furnaces. The construction and operation of some of the simple, self-acting process controllers are explained and the more elaborate controllers are described. This monograph will be useful to students and those involved in the craft and science of instrumentation.

Basic Principles of Electronics, Volume I : Thermionics serves as a textbook for students in physics. It focuses on thermionic devices. The book covers topics on electron dynamics, electron emission, and the thermionic vacuum diode and triode. Power amplifiers, oscillators, and electronic measuring equipment are studied as well. The text will be of great use to physics and electronics students, and inventors.

"For students of plumbing, heating, gas and allied industries..."--Pref.

In the past, the teaching of electricity and electronics has more often than not been carried out from a theoretical and often highly academic standpoint. Fundamentals and basic concepts have often been presented with no indication of their practical applications, and all too frequently they have been illustrated by artificially contrived laboratory experiments bearing little relationship to the outside world. The course comes in the form of fourteen fairly open-ended constructional experiments or projects. Each experiment has associated with it a construction exercise and an explanation. The basic idea behind this dual presentation is that the student can embark on each circuit following only the briefest possible instructions and that an open-ended approach is thereby not prejudiced by an initial lengthy encounter with the theory behind the project; this being a sure way to dampen enthusiasm at the outset. As the investigation progresses, questions inevitably arise. Descriptions of the phenomena encountered in the experiments are therefore given in the explanations. Although these were originally intended to be for the teacher's guidance they have been found, in fact, to be quite suitable for use by the student. In the explanations mathematics has been eliminated wherever possible, mechanistic descriptions of phenomena being preferred in all cases. Stress is thereby placed on concepts rather than on mere algebraic relationships. It is hoped that students of weak mathematical background will, as a result, not be prevented from following the explanations and deriving some benefit from these.
