Building on his pathbreaking, award-winning bestseller, *Relevance Lost*, H. Thomas Johnson presents a devastating critique of the top-down hierarchical accounting systems that have dominated American corporations since the 1950s. In *Relevance Regained*, Johnson shows exactly how "managing by remote control" through results-oriented accounting information has obstructed the real business objective: to reduce process variation and lead times for the purpose of obtaining and keeping satisfied customers. The failure of most American businesses to be competitive and profitable, he contends, is their reliance on management accounting information to control people's actions and productivity. Cost-focused imperatives from on high must be replaced, Johnson asserts, with information systems that link actions with imperatives of global competition. Self-managing work teams, according to Johnson, must own problem-solving information to reduce variation, delays, and excess in processes. Johnson prescribes the necessary changes in management principles that must replace the outdated style associated with the industrial revolution. Responsiveness to customers—not accounting costs—and flexibility—reducing lead times and removing constraints—are necessary for sustained

competitive excellence and long-term profitability. Johnson discusses the radical overhauls of companies, such as General Electric's work-outs/"best practices" program and Harley-Davidson's work simplification programs, and shows how these strong commitments to new strategies maximize a company's most important assets: people and time. To be globally competitive, he claims, a company's work must be directed toward selling to customers, not just selling products.

Visual Thinking brings the science of perception to the art of design. Designers increasingly need to present information in ways that aid their audience's thinking process. Fortunately, results from the relatively new science of human visual perception provide valuable guidance. In this book, Colin Ware takes what we now know about perception, cognition, and attention and transforms it into concrete advice that designers can directly apply. He demonstrates how designs can be considered as tools for cognition – extensions of the viewer's brain in much the same way that a hammer is an extension of the user's hand. The book includes hundreds of examples, many in the form of integrated text and full-color diagrams. Experienced professional designers and students alike will learn how to maximize the power of the information tools they design for the people who use them. Presents visual thinking as a complex process that can be supported in every stage using specific design techniques Provides practical, task-oriented information for designers and software developers charged with design responsibilities Includes hundreds of examples, many in the form of integrated text and full-color diagrams Steeped in the principles of "active vision, which views graphic designs as cognitive tools Most aviation accidents are attributed to human error, pilot error especially. Human error also greatly effects productivity and profitability. In his overview of this collection of papers, the editor points out that these facts are often misinterpreted as evidence of deficiency on the part of operators involved in accidents. Human factors research reveals a more accurate and useful perspective: The errors made by skilled human operators - such as pilots, controllers, and mechanics - are not root causes but symptoms of the way industry operates. The papers selected for this volume have strongly influenced modern thinking about why skilled experts make errors and how to make aviation error resilient.

The rapid growth of home health care has raised many unsolved issues and will have consequences that are far too broad for any one group to analyze in their entirety. Yet a major influence on the safety, quality, and effectiveness of home health care will be the set of issues encompassed by the field of human factors research--the discipline of applying what is known about human capabilities and limitations to the design of products, processes, systems, and work environments. To address these challenges, the National Research Council began a multidisciplinary study to examine a diverse range of behavioral and human factors issues resulting from the increasing migration of medical devices, technologies, and care practices into the home. Its goal is to lay the groundwork for a thorough integration of human factors research with the design and implementation of home health care devices, technologies, and practices. On October 1 and 2, 2009, a group of human factors and other experts met to consider a diverse range of behavioral and human factors issues associated with the increasing migration of medical devices, technologies, and care practices into the home. This book is a summary of that workshop, representing the culmination of the first phase of the study.
