The Race To The Top program strongly advocates the use of computer technology in assessments. It dramatically promotes computer-based testing, linear or adaptive, in K-12 state assessment programs. Moreover, assessment requirements driven by this federal initiative exponentially increase the complexity in assessment design and test development. This book provides readers with a review of the history and basics of computer-based tests. It also offers a macro perspective for designing such assessment systems in the K-12 setting as well as a micro perspective on new challenges such as innovative items, scoring of such items, cognitive diagnosis, and vertical scaling for growth modeling and value added approaches to assessment. The editors' goal is to provide readers with necessary information to create a smarter computer-based testing system by following the advice and experience of experts from education as well as other industries. This book is based on a conference (<http://marces.org/workshop.htm>) held by the Maryland Assessment Research Center for Education Success. It presents multiple perspectives including test vendors and state departments of education, in designing and implementing a computer-based test in the K-12 setting. The design and implementation of such a system requires deliberate planning and thorough considerations. The advice and experiences presented in this book serve as a guide to practitioners and as a good source of information for quality control. The technical issues discussed in this book are relatively new and unique to K-12 large-scale computer-based testing programs, especially due to the recent federal policy. Several chapters provide possible solutions to psychometricians dealing with the technical challenges related to innovative items, cognitive diagnosis, and growth modeling in computer-based linear or adaptive tests in the K-12 setting.

First published in 2001, this volume demonstrates how computer-based learning has the potential to provide a highly motivating learning experience, that it also has the potential to achieve exactly the opposite, and that the difference between these two extremes is the quality of the learning design. The challenge for the learning designer isn't a simple one. You are being asked to prepare interactive learning for someone you can't see and with whom the only interaction you are likely to have is via limited written communication. Fortunately help is at hand in Alan Clarke's *Designing Computer-Based Learning Materials*. Dr. Clarke offers a definitive guide to each of the many elements involved in good design. This book explores the principles of adult learning, and relates to the potential, features and impact of computer-based learning. This is not a 'how to...' book, but rather one seeking to help you understand the different elements which go into computer-based learning. If you are commissioning material, it will help you to understand the contractors' constraints. If you are designing materials yourself, it will allow you to avoid many of the errors it is all too easy to make when developing them. Computer-based learning materials are not all the same: their range reflects the variety of learners that use them and purposes they are used for; the different learning environments that are available to people; the different subjects that they wish to learn and the level to which they wish to take them. In the face of such a complex task, involving so many factors and variables, it is essential that the learning designer understands what is involved and uses a rigorous process for envisioning, planning, designing, implementing and testing their solution. This is a book about learning design and not about software production and, as such, it provides any aspiring designers with the fundamentals of producing the highly motivating learning experience, which should be their objective.
