The book introduces pragmatic constructivism as a paradigm for understanding actors' construction of functioning practice and for developing methods and concepts for managing and observing that practice. The book explores, understands and theorises organisational practices as constructed through the activities of all organisational actors. Actors always act under presumptions of a specific actor-world-relation which they continuously construct, adjust and reconstruct in light of new experiences, contexts and communication. The outcome of the actor-world-relation is a reality construction. The reality construction may function successfully or it may be hampered by fictitious and illusionary elements, due to missing or faulty actor-world relations. The thesis is that four dimensions of reality – facts, possibilities, values and communication – must be integrated in the actor-world-relation if the construct is to form a successful basis for effective, functioning actions. Drawing on pragmatic constructivism, the book provides concepts and ideas for studies regarding actors and their use of management accounting models in their construction of organized reality. It concentrates on researching and conceptualizing what creates functioning reality construction. It develops concept and methods for understanding, analysing and managing the actors' reality constructions. It is intended for people who do research on or work actively with developing management accounting.

The world of construction is intrinsically linked with that of finance, from the procurement and tendering stage of projects right through to valuation of buildings. In addition to this, things like administrations, liquidations, mergers, take-overs, buy-outs and floatations affect construction firms as they do all other companies. This book is a rare explanation of common construction management activities from a financial point of view. While the practical side of the industry is illustrated here with case studies, the authors also take the time to build up an understanding of balance sheets and P&L accounts before explaining how common tasks like estimating or valuation work from this perspective. Readers of this book will not only learn how to carry out the tasks of a construction cost manager, quantity surveyor or estimator, they will also understand the financial logic behind them, and the motivations that drive senior management. This is an essential book for students of quantity surveying or construction management, and all ambitious practitioners.

Proper cost accounting and financial management are essential elements of any successful construction job, and therefore make up essential skills for construction project managers and project engineers. Many textbooks on the market focus on the theoretical principles of accounting and finance required for head office staff like the chief financial officer (CFO) of a construction firm. This book's unique practical approach focuses on the activities of the construction management team, including the project manager, superintendent, project engineer, and jobsite cost engineers and cost accountants. In short, this book provides a seamless connection between cost accounting and construction project management from the construction management practitioner's perspective. Following a complete accounting cycle, from the original estimate through cost controls to financial close-out, the book makes use of one commercial construction project case study throughout. It covers key topics like financial statements, ratios, cost control, earned value, equipment depreciation, cash flow, and pay requests. But unlike other texts, this book also covers additional financial responsibilities such as cost estimates, change orders, and project close-out. Also included are more advanced accounting and financial topics such as supply chain management, activity-based accounting, lean construction techniques, taxes, and the developer's pro forma. Each chapter contains review questions and applied exercises and the book is supplemented with an

eResource with instructor manual, estimates and schedules, further cases and figures from the book. This textbook is ideal for use in all cost accounting and financial management classes on both undergraduate and graduate level construction management or construction engineering programs.

This authoritative text provides a detailed insight into how construction companies manage their finances at both corporate and project level. It will guide students and practitioners through the complexities of the financial reporting of construction projects within the constraints of accepted accounting practice. The book is written for non-accountants and from a contractor's perspective and is equally relevant to subcontractors and main contractors. The authors examine the relationship between the external annual accounts and the internal cost-value reconciliation process. CVR is covered in depth and the authors consider issues such as interim payments, subcontract accounts, contractual claims, final accounts, cash flow management and the reporting of the physical and financial progress of contracts. A broad perspective of all the financial aspects of contracting is taken along with related legal issues and the authors explain how things operate in the 'real world'. They describe good practice in financial control while at the same time being honest about some of the more questionable practices that can - and do - happen. The approach taken is unique as the financial management of construction projects is considered from the perspective of the contractor's quantity surveyor. The book deals with the real issues that surveyors have to address when using their judgment to report turnover, profitability, cash flow, and work in progress on projects and the financial problems faced by subcontractors are frankly and pragmatically explored. The payment and notice requirements of the Construction Act are explained in detail and relevant provisions of JCT2011, NEC3, ICC, DOM/1 and other standard contracts and subcontracts are also covered. Financial Management in Construction Contracting addresses the wide variety of external factors that influence how construction companies operate, including government policy, banking covenants and the financial aspects of supply chain management. Cost reporting systems are described and real-life examples are used to illustrate cost reports, accrual systems and how computerised systems can be employed to provide the QS with information that can be audited. Examples drawn from practice demonstrate how work-in-progress (WIP) is reported in contracting. Cost value reconciliation reports are featured and the book demonstrates how adjustments are made for overmeasure, undermeasure, subcontract liabilities and WIP as well as explaining the processes that contractors use when analysing external valuations. This is the ideal core text for final year degree and post-graduate level modules on Quantity Surveying, Commercial Management, Construction Management and Project Management courses and will provide an invaluable source of reference for quantity surveyors and others who may be engaged in the financial management of construction projects. It explains the impact of additional management reports and how they can enhance and facilitate a manager's job. The key measurements that residential construction professionals should track. The integration of job cost accounting with estimating, purchasing, and scheduling. The profit center concept for multiple-project companies and its reporting requirements. Every company should produce monthly financial statements and other reports for management use. Just as any home or building must rest on a secure

and solid foundation, an understanding of accounting should be the firm foundation upon which a company rests. Excerpt from Construction Accounting and Financial Management Although accounting principles do not change, I think it is reasonable to say that their application to any particular industry, and to any specific business in that industry, usually requires careful analysis and sound judgment. This statement is certainly true of the construction industry. This book cannot take the place of detailed information nor of the experience with individual problems of any particular construction company. It can, however, survey the problems peculiar to the construction industry and indicate how to apply standard accounting techniques to arrive at sound solutions. With operating conditions so varied and the individual contractor's circumstances likely to be so complex, it is often necessary to go back and review basic accounting and business principles in relation to the specific conditions in a given company before management can use accounting as a true operational tool. It is for this reason that this book is devoted more to the why than to the how of construction accounting. Certainly, among the techniques described, the experienced accountant will find few, if any, that are basically unfamiliar to him, but he may see them applied in ways that may be somewhat unexpected. With construction activity increasing and significant changes to the revenue recognition model, it is more important than ever for accountants and financial managers to be on top of the very latest in accounting and auditing changes for the construction industry. This guide examines the most recent updates and key issues impacting construction accounting and auditing. It covers new changes as a result of FASB ASU 2014-09, it also explores the relationship between the contractor and the surety. Construction Accounting addresses every aspect of the accounting for a construction business. The intent is to not only explain accounting concepts, but also provide examples and show how an accounting system can be constructed and operated. The book pays particular attention to unique aspects of construction accounting that are not encountered in other industries, including the job cost ledger, change orders, back charges, percentage of completion calculations, and the treatment of anticipated losses on contracts.

Practical Construction Accounting and Financial Management provides instructions, training, exercises, and examples of the fundamentals that successful construction contractors must master: the ability to capture, summarize, analyze, and forecast operation data to be better informed when making project and business decisions. Typically, a project manager is not involved with data entry but is a source of data collection. Often the project manager's lack of understanding of accounting systems creates a situation where the project manager's role in the data retrieval and entry is compromised. This compromise results in poor decisions being made by the project and company managers due to inaccurate and untimely data. This book provides current and future construction professionals with an awareness of fundamental accounting concepts and financial principles to successfully manage the finances of construction companies, including accurately pricing projects based on actual overhead and profit recovery needs, successfully controlling the cost to operate a construction company through the comparison between company budgets and actual financial statements, and proactively forecasting cash needs before falling into a potential cash trap that could force the company into bankruptcy.
