Relational Contracting for Construction Excellence Albert P Chan, Daniel W Chan, John F Yeung, 2009-09-23 Improved efficiency and effectiveness in the construction industry provide huge potential savings. Various forms of relational contracting such as partnering, alliancing, public private partnership (PPP), and joint venture are good examples of this. Relational Contracting for Construction Excellence presents the principles of relational contracting, practicalities and a series of short case studies. Principles begins with the fundamentals then covers development in major countries, definitions of relational contracting, their benefits, difficulties, critical success factors and key performance indicators. Practice includes the relational contracting approach and process in general, and significant factors which make workshops successful, at whatever stage of the process. A number of real-life case studies from the UK, USA, Australia, and Hong Kong are provided. Since the book draws on a combination of practical consultancy works and university research, a wide range of readers will find it useful, i.e. from industrial practitioners to undergraduate students.

**Project Management Metrics, KPIs, and Dashboards** Harold Kerzner, 2011-07-15 Essential strategies from Harold Kerzner on measuring project management performance The maze-like path of today's projects reflects a business environment that's growing in complexity. Factors influencing projects, such as new advancements in computer technology, an unpredictable economy, and the increase in stakeholder involvement make metrics and key performance indicators (KPI) for project management an important focus. Such measures are commonly used to help an organization define and evaluate how successful it is, typically, in terms of making progress towards its long-term organizational goals. Project Management Metrics, KPIs, and Dashboards helps functional managers gain a thorough understanding of what metrics are and how they can be best implemented to gain traction in a fast-paced and diverse working atmosphere. With content aligned with PMI's PMBOK® Guide, this book offers extensive coverage on KPIs and how they may be monitored, using techniques such as business dashboards to assist in prescribing meaningful business strategies. After reading this book, functional managers

will bolster their awareness of what good metrics management really entails—and be armed with the knowledge to measure performance more effectively. This book begins with basic KPI principles, helping functional managers deal with such key issues as: Successfully integrating KPIs and metrics into managing a project within a business strategy Important business dashboard techniques used in monitoring performance What is really important to different stakeholders in a project Managing resistance to change Next the book explores the key questions to ask before implementing a dashboard or reporting system. Some of these questions include: What are your needs? What is involved in integration? What's involved in operations and maintenance? What does the system cost? How long will the system last? Throughout the book, helpful illustrations clarify complex concepts and processes. These illustrations are also available as PowerPoint slides for course and seminar presentations.

*Site Management Teams and Project Performance in the UK Construction Industry* Stuart Tennant, 2007 Genuine team working is inextricably associated with good performance. Within the United Kingdom construction industry the need for team working is extensive. A proper understanding of teams and the advancement of construction team management capacity would have far-reaching benefits for the sector. The research programme investigates the empirical relationship between construction site management team efficiency and project performance. The adopted case study methodology employs various data gathering techniques. The team variable ratings are evaluated using an attitude statement questionnaire. The team member questionnaire addresses seven key variables identified from the team literature review as a precondition for enhanced team performance. The responses are collated, analysed and presented collectively as a team percentage rating. Project performance is evaluated using seven key performance indicators. The KPI's have been carefully selected to align with four business perspectives derived from Kaplan and Norton's Balanced Scorecard concept. The resultant customised balanced scorecard provides a holistic measure of project well-being. The responses are collated, analysed and presented collectively as a project percentage score. Various statistical techniques test the strength of relationship between the site team and project performance within a construction site setting. The research findings authenticate the team-performance relationship and demonstrate the potential significance of a diagnostic toolkit designed to assess the 'health' of the site team dynamic. The innovative performance management model provides a roadmap for positive team management intervention and subsequent employment of tailor-made team building programmes. The concept is transferable. Opportunities exist to develop the initiative not only within the confines of construction team management but also beyond industry boundaries. For example, project performance scorecards, reward management and team performance pay.

Benchmarking in Construction Steven McCabe, 2008-04-30 This is the first post-Egan book to look at benchmarking and KPIs (key performance indicators) in the construction industry. Benchmarking is one of the key management techniques the

construction industry now needs to adopt if it is to meet challenging new efficiency and productivity targets as well as clients' demands for best value. Contracts are increasingly being awarded only to contractors who can demonstrate the lean construction practices that come with benchmarking. This authoritative and accessible book: \* clarifies the thinking behind benchmarking and why firms must now adopt it \*shows how to set up effective benchmarking \*explains the theoretical background and offers clear, practical guidance \*demonstrates best practice through reference to case studies. There are nine case studies describing the use of KPIs and the application of the EFQM excellence model - including contributions from Morrison and John Mowlem The author Steve McCabe is senior lecturer in the School of Property and Construction at the University of Central England in Birmingham. He has conducted extensive research in quality improvement techniques and benchmarking and has wide experience in industry with a number of contractors and within the local authority sector.

**The Construction Industry in the Fourth Industrial Revolution** Clinton Aigbavboa, Wellington Thwala, 2019-08-09 This book gathers papers from the 11th Construction Industry Development Board (cidb) Postgraduate Research Conference, held on 28-30 July 2019 in Johannesburg, South Africa. The conference provided an essential forum for reviewing and generating knowledge on Construction 4.0 and, consequently, highlighted processes and practices that allow us to deliver and operate built environment assets more effectively and efficiently by focusing on physical-to-digital and digital-to-physical transformation. The event addressed three broad themes: Industrial production (prefabrication, 3-D printing and assembly, offsite and advanced manufacturing); Cyber-physical systems (actuators, sensors, IoT, robots and cobots for repetitive and dangerous tasks, and drones for mapping, progress monitoring, safety and quality inspections, lifting, moving and positioning); and Technologies (digital ecosystems, digital platforms, BIM, video and laser scanning, AI and cloud computing, big data and data analytics, reality capture, blockchain, simulation, virtual and augmented reality, data standards and interoperability, and vertical and horizontal integration). Given its scope, the book will be of interest to all construction industry and architectural professionals who want to learn about cutting-edge technologies applied to construction

**Performance Measurement, Forecasting and Optimization Models for Construction Projects** Seyedeh-Sara Fanaei, 2019 Performance evaluation facilitates tracking and controlling project progress. Project control consists of two main steps: measurement and decision-making. In the measurement step, key performance indicators (KPIs) are designed to evaluate a project's different aspects and are used as a thermometer to determine the health status of the project. In the decision-making step project performance is forecasted and analyzed to support needed management actions. While considerable work is available on the quantitative performance of projects, less attention is directed to qualitative performance. This research presents a framework for qualitative measurement, prediction, and optimization of construction project performance to enhance the progress reporting process and to support management in taking corrective actions, if needed. The framework has three newly developed models; KPI prediction model, performance indicator (PI) prediction

model and performance optimization model (POM). The framework is developed for performance measurement, prediction, and optimization of construction projects based on six selected KPIs (cost, time, quality, safety, client satisfaction, and project team satisfaction). The selection is based on the results of a questionnaire and the literature review. Qualitative data of KPIs was collected from 119 construction projects and were then utilized in the development of the three models. The first model maps the KPIs of three critical project stages to the whole project KPIs, based on soft computing methods. Three different soft computing techniques are studied for this purpose and their results are compared: the neuro-fuzzy technique, using Fuzzy C-means algorithm (FCM), and subtractive clustering, and artificial neural networks (ANN). The neuro-fuzzy model is developed for predicting the KPIs of the next stages of a project. The second model used the forecasted results of the first model to generate a single composite PI expressing the health status of the project. The relative weight of each KPI used in calculating the project PI is determined using the Analytic Hierarchy Process (AHP) and Genetic Algorithm (GA). Performance Optimization Model (POM) is the third model. It is used for selecting suitable corrective actions considering the project status expressed by the six KPIs stated above. The developed model can be applied in the initial and middle stage of the project to assist owners in the improvement of the overall project PI and in the improvement of individual KPIs. Different possible modes are considered for project activities based on different ways, referred to here as modes, for resource allocation, execution methods, and/or choice of different materials. GA is applied to choose among different activity modes and optimize project performance using POM. The number of activities and their modes are flexible and do not have any limitations. MATLAB software is used for developing the models in this research. The developed framework and its three models are expected to assist owners and their agents in managing their project effectively. Validation was conducted by using the data from 16 real projects to confirm the model's effectiveness and to compare the results of the soft computing techniques. These results indicate that a neuro-fuzzy technique using subtractive clustering performs better than both the neuro-fuzzy technique with FCM and ANN in predicting project KPIs. The automated framework employs a set of performance indicators to evaluate, predict, and optimize the construction project's performance, qualitatively. It applies different soft computing techniques and compares their results to choose the best technique. The developed framework can be used in construction projects to help decision-makers evaluate and improve the performance of their projects.

Key Performance Indicators David Parmenter, 2019-10-29 The new edition of the bestselling guide on creating and using key performance indicators—offers significant new and revised content Key Performance Indicators (KPIs) help define and measure the organizational goals which are fundamental to an organization's current and future success. Having solid KPIs is crucial for companies that are implementing performance management systems, such as balanced scorecards, six sigma, or activity-based management. In many organizations, KPIs are often too numerous, randomly assembled, and overly complex—essentially rendering them ineffectual, or at worse, counterproductive. Key Performance Indicators provides a

model for simplifying the complex areas of KPIs while helping organizations avoid common mistakes and hazards. Now in its fourth edition, this bestselling guide has been extensively revised and updated to incorporate practical lessons drawn from major implementations. Fresh content includes a more concise KPI methodology with clear implementation guidance, original insights on how other areas of performance management can be corrected, and new in-depth case studies. A revised starter kit is included to identify critical success factors, and the KPI resource kit contains updated worksheets, workshop programs, and questionnaires. Helping readers to better define and measure progress toward goals, this important guide: Dispels the myths of performance measurement and explains a simple, yet powerful KPI methodology Explains the 12-step model for developing and using KPIs with guidelines Helps readers brainstorm performance measures, sell KPI projects to the Board and senior management, and accurately report performance Features the “KPI Project Leaders Corner” which provides readers with essential information and useful exercises Includes an array of practical tools—templates, checklists, performance measures—and a companion website ([www.davidparmenter.com](http://www.davidparmenter.com)) Key Performance Indicators: Developing, Implementing, and Using Winning KPIs, 4th Edition is important resource for C-suite executives, senior management, project teams, external project facilitators, and team coordinators involved in all aspects of performance management systems.

**The Development of Key Financial Performance Indicators for U.K Construction Companies** Mohamed A. Hegazy, 2014 Over the past decade, the significance of business performance measurement has spread across various industries. The UK construction industry has been criticized for its underachievement and a number of industry reports (i.e. the Egan (1998) and Latham (1994) reports) have emphasized the need for performance measurement. As a result, the Construction Best Practice Program-Key Performance Indicators (CBPP-KPI) was launched for performance measurement. Additionally, an industry-wide benchmarking model which was created to enable construction companies to benchmark their performance was criticized since it focuses only on project level measures. This research develops financial industry norms for UK construction companies. A set of Key Financial Performance Indicators (KPI's) is developed based on a survey of performance measurement and benchmarking techniques in the accounting literature. A benchmarking model based on financial KPI's is produced for construction companies to benchmark and evaluate their business performance at corporate level. A record sheet and a set of financial guidelines for companies to improve their performance were developed. Two case studies of contractors were presented showing the advantages and disadvantages of the developed model. Radar and Wall

charts showed how each contractor can compare its performance with the U.K industry norms directing management to areas requiring significant improvement. Future research should continue to develop elements of the financial KPI's and assess the application of the developed benchmark model to other industries and investigate weaknesses associated with its application.

**Construction Project Management** Peter Fewings,2013-05-07 The role of the project manager continues to evolve, presenting new challenges to established practitioners and those entering the field for the first time. This second edition of Peter Fewings' groundbreaking textbook has been thoroughly revised to recognise the increasing importance of sustainability and lean construction in the construction industry. It also tackles the significance of design management, changing health and safety regulation, leadership and quality for continuous improvement of the service and the product. Using an integrated project management approach, emphasis is placed on the importance of effectively handling external factors in order to best achieve an on-schedule, on-budget result, as well as good negotiation with clients and skilled team leadership. Its holistic approach provides readers with a thorough guide in how to increase efficiency and communication at all stages while reducing costs, time and risk. Short case studies are used throughout the book to illustrate different tools and techniques. Combining the theories underpinning best practice in construction project management, with a wealth of practical examples, this book is uniquely valuable for practitioners and clients as well as undergraduate and graduate students for construction project management.

**Designing a Framework to Estimate Project Duration with Respect to Weather Risk and Creating a Navigational Support System in Benchmark Space** Foad Marzoughi,2018 Construction projects often do not meet their targets, and usually face time and cost overruns (Agyakwah-Baah & Fugar, 2010; Memon, Abdul, & Abdul, 2012). Due to the complexity and dynamic nature of these projects, it is difficult for project managers to meet project objectives (Collyer & Warren, 2009). A substantial amount of work has been done to overcome this problem by developing different tools and methods, yet often projects still cannot meet their targets (Acebes, Pajares, Galán, & López-Paredes, 2014; Y. Chen, Zhang, Liu, & Mo, 2012). In the construction industry, a rich body of research has emerged to develop frameworks and tools for project management. The majority of current tools do not consider the dynamic nature of projects (Franceschini, Maurizio, & Domenico, 2007). Therefore, in this research, a decision support framework has been developed for the planning phase of a project lifecycle. In addition, a navigational support system has been created for the execution phase of the project lifecycle to monitor and control project performance. This thesis focuses on creating two artefacts: [1] a decision support framework for planning construction projects under uncertainty, in particular, severe weather conditions, and [2] a decision support system as a generic engine for controlling and monitoring key performance indicators at project level. For validation, we applied both artefacts to the construction industry and selected construction projects as cases. It is important to estimate a project's duration properly in the initial phase to avoid cost and time overruns. Thus, the developed decision support framework in this thesis fills the gap in the phase of project planning by estimating project duration and taking into account

the effect of weather on project performance and construction activities. Initial project planning is essential, but it is important to monitor and control the project to bring the project back on track if it veers off from the desired performance. Hence, project managers are keen to know the position of project performance with respect to the agreed criteria and what action to take to bring the project back on track. Thus, a decision support system called Navigational Support System (NSS) has been created to monitor and control project performance among multiple key performance indicators. This research consists of three original papers. Paper I provides a comprehensive review of the literature on the possible causes of delays, the problems with current methods and tools in construction projects in estimating project duration. This paper fills a gap in the literature by proposing a decision support framework to estimate project performance and duration with respect to weather, and presents a model developed through the proposed framework and validated in a real-case construction project. Paper II provides a comprehensive review of literature on the problems of existing performance measurement tools. A conceptual framework of the Navigational Support System (NSS) (Marzoughi & Arthanari, 2016a) based on the idea of navigating in benchmark space, introduced by Arthanari (2010), and the architecture of NSS is proposed. In addition, this paper illustrates the NSS using a case from interior design projects. Finally, Paper III illustrates the implementation of the generic engine proposed in Paper II for further validation in a real-life construction project. In this research, different methodologies have been used to validate both the decision support framework and NSS. In Paper I, multiple methodologies are used to integrate five modules (expert knowledge module, filtration module, multicriteria decision-making module, forecasting module and estimation module) to estimate the duration of construction project activities. Moreover, the techniques applied to integrate weather related variables in the process of estimating the duration of activities affected by weather, such as multivariate data analysis methods including principal component analysis, time series model building approaches, multi-criteria decision-making tools, non-linear multiple regression, and qualitative and quantitative data collection methods are introduced. In Paper II, a Navigational Support System (NSS) is created as a generic engine using design science research methodology. Multivariate statistical techniques and dynamic decision-making techniques were integrated to create the NSS. In Paper III, the NSS has been implemented in construction projects for validating created artefacts. Finally, the efficacy, validity and ease of use of the NSS are evaluated through applying the NSS in a real-life construction project.

Target Cost Contracting Strategy in Construction Daniel W.M. Chan, Joseph H.L. Chan, 2016-10-14 The problems inherent in the traditional design-bid-build procurement method often lead to the adversarial working relationships within the construction industry. Target cost contracts, accompanied by a gain-share/pain-share arrangement serving as a cost incentive mechanism, have emerged in the United States, the United Kingdom, Australia and Hong Kong with the aim of achieving better value for money and more satisfactory overall project performance under a collaborative working

relationship. This book presents the underlying principles, practicalities and a series of short case studies of applying the target cost contracting strategy. Principles begin with the fundamentals then cover the development of target cost contracting in major countries/cities, definitions of target cost contracting, perceived benefits, potential difficulties and critical success factors for implementation. Practices include the target cost contracting approach and process in general, the key risk factors, risk assessment model, risk allocation and risk mitigation measures for target cost contracts in particular, together with a conceptual framework for the performance measurement of target cost contracts. Several short real-life case studies from the United Kingdom, Hong Kong, Australia and New Zealand are provided for further illustration. The book will appeal to a wide spectrum of readers from industrial practitioners to undergraduate students, researchers and academics interested in construction contracts and procurement methods.

**Evaluating the Impact of Building Information Modeling (BIM) on Construction** Patrick C. Suermann, 2009  
ABSTRACT: This research assessed the impact of Building Information Modeling (BIM) implementation on construction projects according to six primary key performance indicators (KPIs) commonly used in the construction industry as accepted metrics for assessing project performance. These include: quality control (rework), on-time completion, cost, safety (lost man-hours), dollars/unit (square feet) performed, and units (square feet) per man hour. In the first research phase, data was collected through a survey instrument intended to assess practitioners' perceptions about the impact of BIM on the six KPIs. Three iterations of the survey were conducted and it was determined that the highest ranking KPIs in order of most favorable responses were quality control, on time completion, and units per man hour. The second tier of favorable responses included overall cost and cost per unit. In this second phase of research, projects were evaluated through interviews and case studies on-site at two U.S. Army Corps of Engineer (USACE) Districts in Seattle, WA and Louisville, KY to determine their KPIs through embedded research. In the third phase of research, quantitative results were gathered from the USACE construction productivity database interface: the Resident Management System (RMS). Subsequently the pilot projects were compared to a control dataset consisting of similar facilities across the USACE using traditional approaches through benchmarks aligned with metrics similar to the KPIs used in the surveys. Both BIM-based projects demonstrated statistically significant (favorable and unfavorable) performance differences when compared to the control dataset. Finally, an evaluation tool was developed and validated for implementing a construction productivity measurement system to supplement existing procedures suitable for evaluating construction productivity differences on BIM-based projects.
