An introduction to cryptocurrencies and blockchain technology; a guide for practitioners and students. Bitcoin and blockchain enable the ownership of virtual property without the need for a central authority. Additionally, Bitcoin and other cryptocurrencies make up an entirely new class of assets that have the potential for fundamental change in the current financial system. This book offers an introduction to cryptocurrencies and blockchain technology that begins from the perspective of monetary economics. The book first presents a nontechnical discussion of monetary theory, enabling readers to understand how cryptocurrencies are a radical departure from existing monetary instruments, and provides an overview of blockchain technology and the Bitcoin system. It then takes up technical aspects of Bitcoin in more detail, covering such topics as the Bitcoin network, its communications protocol, the mathematics underpinning decentralized validation, transaction types, the data structure of blocks, the proof-of-work consensus mechanism, and game theory. Finally, the book discusses specific issues and applications, including price volatility, regulatory uncertainty, and central bank cryptocurrencies, as well as such alternative applications as decentralized verification and attestation, tokens, and smart contracts. The concluding chapter offers practical advice on getting started with Bitcoin. End-of-chapter exercises allow readers to test their knowledge. Bitcoin, Blockchain, and Cryptoassets is suitable for classroom use and as a reference for practitioners.

Cryptocurrencies share many alternative asset features, but are hampered by high volatility, sluggish commercial acceptance, and regulatory uncertainties. This collection of papers addresses alternative assets and cryptocurrencies from economic, financial, statistical, and technical points of view. It gives an overview of their current state and explores their properties and prospects using innovative approaches and methodologies.

This also meant a high degree of regulation and government scrutiny that led to manipulation, but then came Bitcoin. Bitcoin is a decentralized virtual currency that is not controlled by anyone, and that doesn't require a third-party intervention. It was created by a figure known as Satoshi Nakamoto in 2008. His identity is still unknown, and he vanished from the online world a few years after introducing the world to the revolutionary technology of Bitcoin. Bitcoin's value has increased over the years because of its popularity, and many people have made a lot of money from it. Cryptocurrency Mining has been here for awhile. When Cryptocurrencies started to gain transaction, more and more people started investing in Bitcoin and Altcoins. And once you get a hand on investing, you started to look for other ways to get more coins. The transition is mostly as investors and then to miner. And for those developers, it is the other way around. So what is the advantage of mining than buying coins? You have super powers. You can literally make your own currency from nothing. It feels like you are doing something, instead of buying. It's fun. You get to play on the cool and fast hardware like ASIC's, GPU's and FPGA's. You are making money. Oh I mean crypto coins. And that means whatever you mine, you can get it higher if you just HODL.

Mining can be challenging. You get to build a mining rig that can surpass your friends set up. You will be the coolest of your friends (and you make the most money too). You're using someone else computer hardware without them knowing, and they don't care (or they don't know). You get a new hobby that is exciting! Not just because of you mining (like the old job of mining gold), but also because Cryptocurrency in general is exciting. Prices fluctuates a thousand times in a week. Not having to deal with exchanges. No transaction fees to take care of, and you can even be a seller of coins if you can mine a lot of them. You can help strengthen the network and helps to protect it to 51% attack. By being a mining, you get to have a vote where Bitcoin will lead. You as a miner can record the block and transaction. You get to make a consensus of where Bitcoin and other coins are headed. Isn't this cool? You can choose what to mine. You can have Bitcoin, Ethereum, Auroracoin, Putincoin, Dash, Ripple, Digibyte, Nxt, Monero, Emercoin, Gridcoin, Iota, ZCash, Peercoin, Ybcoin, Dogecoin, Litecoin, EOS, etc) To give you ideas on what you can get out of this book, below are just some of the topic that I tackle: What is Cryptocurrency?
