The 21st Century Truck Partnership (21CTP), a cooperative research and development partnership formed by four federal agencies with 15 industrial partners, was launched in the year 2000 with high hopes that it would dramatically advance the technologies used in trucks and buses, yielding a cleaner, safer, more efficient generation of vehicles.

Review of the 21st Century Truck Partnership critically examines and comments on the overall adequacy and balance of the 21CTP. The book reviews how well the program has accomplished its goals, evaluates progress in the program, and makes recommendations to improve the likelihood of the Partnership meeting its goals. Key recommendations of the book include that the 21CTP should be continued, but the future program should be revised and better balanced. A clearer goal setting strategy should be developed, and the goals should be clearly stated in measurable engineering terms and reviewed periodically so as to be based on the available funds.

After 1945 many countries needed new vehicles in order to replace those that had been destroyed or worn out in the war and so British factories were offered incentives to produce and export lorries. Foden were one such company to take advantage of the opportunities available and in the 1950s, had agents in almost every West European country. In the 1970s when the European market had declined, the Middle East, Australia and South Africa markets rose to prominence and from the 1980s onwards, New Zealand became the primary destination for the marque. By the time production finally ceased in 2006, they had sold vehicles all over the world. The vehicles produced for export differed greatly from the designs used in Britain. In many countries the gross weights of vehicles exceeded the British values significantly, so the majority of Foden export vehicles had much stronger chassis, gearboxes, axles, suspensions and more powerful engines than their British counterparts. Many also had tropical double roofs to keep the heat out and sleeper cabs, long before they became common in the UK. This comprehensive book detailing the lorries that Foden exported around the world, follows on from the publication of the author's first book about the Fodens produced and used within the UK (Foden Special Vehicles). It includes 364 fascinating photographs, many of which have never been previously published and will be of interest to all Foden fans and transport enthusiasts in general.

Diesel particulate filters are designed to reduce or virtually eliminate ultrafine particulate emissions, specifically the solid diesel soot fraction. This book covers the latest and most important research in this field, focusing mainly on the advances of the last five years (2002-2006).

Technologies and Approaches to Reducing the Fuel Consumption of Medium- and Heavy-Duty Vehicles evaluates various technologies and methods that could improve the fuel economy of medium- and heavy-duty vehicles, such as tractor-trailers, transit buses, and work trucks. The book also recommends approaches that federal agencies could use to regulate these vehicles' fuel consumption. Currently there are no fuel consumption standards for such vehicles, which account for about 26 percent of the transportation fuel used in the U.S. The miles-per-gallon measure used to regulate the fuel economy of passenger cars. is not appropriate for medium- and heavy-duty vehicles, which are designed above all to carry loads efficiently. Instead, any regulation of medium- and heavy-duty vehicles should use a metric that reflects the efficiency with which a vehicle moves goods or passengers, such as gallons per ton-mile, a unit that reflects the amount of fuel a vehicle would use to carry a ton of goods one mile. This is called load-specific fuel consumption (LSFC). The book estimates the improvements that various technologies could achieve over the next decade in seven vehicle types. For example, using advanced diesel engines in tractor-trailers could lower their fuel consumption by up to 20 percent by 2020, and improved aerodynamics could yield an 11 percent reduction. Hybrid powertrains could lower the fuel consumption of vehicles that stop frequently, such as garbage trucks and transit buses, by as much 35 percent in the same time frame.

The development of the truck in the U.S. from 1895 to 1978 is examined year by year and brief biographies of important early innovators are included

This book covers the various advanced reciprocating combustion engine technologies that utilize natural gas and alternative fuels for transportation and power generation applications. It is divided into three major sections consisting of both fundamental and applied technologies to identify (but not limited to) clean, high-efficiency opportunities with natural gas fueling that have been developed through experimental protocols, numerical and high-performance computational simulations, and zero-dimensional, multizone combustion simulations. Particular emphasis is placed on statutes to monitor fine particulate emissions from tailpipe of engines operating on natural gas and alternative fuels.

Medium- and heavy-duty trucks, motor coaches, and transit buses - collectively, "medium- and heavy-duty vehicles", or MHDVs - are used in every sector of the economy. The fuel consumption and greenhouse gas emissions of MHDVs have become a focus of legislative and regulatory action in the past few years. This study is a follow-on to the National Research Council's 2010 report, Technologies and Approaches to Reducing the Fuel Consumption of Medium- and Heavy-Duty Vehicles. That report provided a series of findings and recommendations on the development of regulations for reducing fuel consumption of MHDVs. On September 15, 2011, NHTSA and EPA finalized joint Phase I rules to establish a comprehensive Heavy-Duty National Program to reduce greenhouse gas emissions and fuel consumption for on-road medium- and heavy-duty vehicles. As NHTSA and EPA began working on a second round of standards, the National Academies issued another report, Reducing the Fuel Consumption and Greenhouse Gas Emissions of Medium- and Heavy-Duty Vehicles, Phase Two: First Report, providing recommendations for the Phase II standards. This third and final report focuses on a possible third phase of regulations to be promulgated by these agencies in the next decade.

This book is a comprehensive study of the evolution of the component aspects of drilling technology in Alberta, from the evolution of power sources and drill bit designs to the composition of drilling muds and the use of fishing tools. Included are explanations of the costs and risks of oil well drilling and of the larger issue of industrial technology -- how it evolves and under what conditions. The author draws extensively from original source material such as interviews, photographs, and appendices from both the Glenbow Archives and the Devon-Leduc Petroleum Hall of Fame and Interpretive Centre.

In chapters that range from solo drivers, families in trucking, and whole customized fleets to the finest nitty-gritty and cutting-edge elements of semi truck customization, this book offers a close-up look at examples of custom semis. Includes before-and-after photos of re-customized trucks; motifs in graphics and design.

A truck driver's tractor-trailer is more than just a vehicle or a tool for making a living. It is a calling card, a personal statement, a way of life. Truckers take as much joy and pride in modifying their rigs as hot-rodders and car customizers. Bette Garber present some two dozen of the most interesting and creative custom trucks to be seen on the roads today. Each feature tells the story of the men and women who modify and drive these trucks, including the tricks of the trade. All are featured in full-color photography that highlights the flash, incredible detail, and personal touches of custom semi trucks. The book also provides an overview of the truck-show scene and what makes for an award-winning rig.

Most vehicles run on fossil fuels, and this presents a major emissions problem as demand for fuel continues to increase. Alternative Fuels and Advanced Vehicle Technologies gives an overview of key developments in advanced fuels and vehicle technologies to improve the energy efficiency and environmental impact of the automotive sector. Part I considers the role of alternative fuels such as electricity, alcohol, and hydrogen fuel cells, as well as advanced additives and oils, in environmentally sustainable transport. Part II explores methods of revising engine and vehicle design to improve environmental performance and fuel economy. It contains chapters on improvements in design, aerodynamics, combustion, and transmission. Finally, Part III outlines developments in electric and hybrid vehicle technologies, and provides an overview of the benefits and limitations of these vehicles in terms of their environmental impact, safety, cost, and design practicalities. In July 2010, the National Research Council (NRC) appointed the Committee to Review the 21st Century Truck Partnership, Phase 2, to conduct an independent review of the 21st Century Truck Partnership (21CTP). The 21CTP is a cooperative research and development (R&D) partnership including four federal agencies-the U.S. Department of Energy (DOE), U.S. Department of Transportation (DOT), U.S. Department of Defense (DOD), and the U.S. Environmental Protection Agency (EPA)-and 15 industrial partners. The purpose of this Partnership is to reduce fuel consumption and emissions, increase heavy-duty vehicle safety, and support research, development, and demonstration to initiate commercially viable products and systems. This is the NRC's second report on the topic and it includes the committee's review of the Partnership as a whole, its major areas of focus, 21CTP's management and priority setting, efficient operations, and the new SuperTruck program.

The decision to write this first-ever biography of J. Irwin Miller stemmed from learning that his children in 2010 had given his papers to the Indiana Historical Society, of Indianapolis, IN, with the intent of helping the public become more familiar with this giant 20th century American industrialist. Known as the Irwin-Sweeney-Miller Collection, the bequest contains 554 boxes of archived, but not digitized, material which took 85 days to sift through manually, page-by-page, the author motivated by the same rush French farmers must get when their hog finds that occasional truffle. Cited in 45% of our foot-notes, the ISM collection not surprisingly was the single biggest source of data for this book. Next in importance were interviews with more than 80 people (five already deceased) across a broad spectrum of Miller's life - care-giver to Congressman, pilot to pastor, banker to board member. Most helpful of all was Miller's son, William I, (Will) Miller, who granted us seven interviews. Additionally, the author relied upon a handful of books about institutions that fundamentally grounded his life, including Cummins Engine, Yale University and Christian Theological Seminary. Nearly forty years living in the Columbus IN area and associating with "the engine company" as, sequentially, employee, supplier and investment analyst have provided the author with unique insights. As a measure of his connectedness, the author knows (or knew) 34 of the 61 persons interviewed for The Engine That Could, the company-sponsored history of Cummins, published in 1997. The author knew Miller personally because their wives were actively involved in running the Columbus branch of the Indianapolis Art Museum.
