The Design Climatology Branch of the Air Force Cambridge Research Laboratories had the scientific responsibility for leading a DoD Task Group effort to revise MIL-STD-210A 'Climatic Extremes for Military Equipment'. This document represents the fruition of the goals of the task group. It relates the background studies supporting the values in MIL-STD-210B, so that MIL-STD-210B users need to consult only this single document for an elaboration on the MIL- STD-210B extremes. In addition, the report contains information on the origin, necessity for and the events leading to a revision of MIL-STD-210A. Discussions of the major changes in the Standard's philosophy and its contents are also provided.

An in-depth reference to the naval weapons used by Britain, Germany, the US, and the other combatants in the Great War, with photos:

“Superb...invaluable.”—History of War Although the Great War might be regarded as the heyday of the big-gun at sea, it also saw the maturing of underwater weapons, the mine and torpedo, as well as the first signs of the future potency of air power. Between 1914 and 1918 weapons development was both rapid and complex, so this book has two functions: on the one hand it details all the guns, torpedoes, mines, aerial bombs and anti-submarine systems employed during that period; but it also seeks to explain the background to their evolution: how the weapons were perceived at the time and how they were actually used. This involves a discussion of tactics and emphasizes the key enabling technology of fire control and gun mountings. In this respect, the book treats the war as a transition from naval weapons which were essentially experimental at its outbreak to a state where they pointed directly to what would be used in World War II. Based largely on original research, this sophisticated book is more than a catalogue of the weapons, offering insight into some of the most important technical and operational factors influencing the war at sea.

In the 1970s tactical nuclear warfare was a topical issue. The introduction of the new generation of tactical nuclear weapons into Europe could have had disastrous consequences. These new weapons had already been

developed by nuclear-weapon laboratories and pressures were growing for their deployment. On first sight, smaller and more accurate nuclear weapons may seem more humane and militarily preferable to the relatively high-yield tactical nuclear weapons currently deployed. But some of these new types of weapons would blur the distinction between nuclear and conventional weapons and their use would make escalation to strategic nuclear war extremely likely. Indeed, the argument for these new weapons is that their use in wartime is more credible (and therefore 'acceptable') than current types of tactical nuclear weapons. This perception could easily lead to the exceedingly dangerous idea that some types of tactical nuclear war were 'winnable'. The fact has to be faced that any use of nuclear weapons is almost certain to escalate until all available weapons are used. To believe otherwise is to believe that one side will surrender before it has used all the weapons in its arsenal. History shows that this is most unlikely to happen. Because of its importance, SIPRI organized a meeting to discuss the whole question. Originally published in 1978, this book is the outcome of that meeting.
