Worldwide economic constraints on health care systems have highlighted the importance of evidence-based medicine and evidence-based health policy. The resulting clinical trials and health services research studies require instruments to monitor the outcomes of care and the output of the health system. However, the over-abundance of competing measurement scales can make choosing a measure difficult at best. Measuring Health provides in-depth reviews of over 100 of the leading health measurement tools and serves as a guide for choosing among them. Now in its third edition, this book provides a critical overview of the field of health measurement, with a technical introduction and discussion of the history and future directions for the field. This latest edition updates the information on each of the measures previously reviewed, and includes a complete new chapter on anxiety measurement to accompany the one on depression. It has also added new instruments to those previously reviewed in each of the chapters in the book. Chapters cover measurements of physical disability, social health, psychological well-being, anxiety, depression, mental status testing, pain, general health status and quality of life. Each

chapter presents a tabular comparison of the quality of the instruments reviewed, followed by a detailed description of each method, covering its purpose and conceptual basis, its reliability and validity and, where possible, shows a copy of the actual scale. To ensure accuracy of the information, each review has been approved by the original author of each instrument or by an acknowledged expert.

This concise guide provides psychiatrists (including trainees) and general practitioners with a comprehensive overview of the most clinically relevant assessment scales and tools in order to assist with and enhance diagnostic outcomes in depression. Depression is one of the most common mood disorders across the globe, with a lifetime prevalence across all people of 8-10%. Despite being relatively common, depression remains severely underdiagnosed across all age groups and nationalities.

Mental disorders such as attention-deficit hyperactivity disorder (ADHD), depression, and autism have devastating consequences on the lives of children and adolescents. Early assessment of their mental health problems is essential for preventative measures and intervention. This timely, authoritative guide will be of interest to everyone involved i

The Structured Clinical Interview for DSM-IV Axis II Personality Disorders (SCID-II) is an efficient, user-friendly instrument that will help researchers and clinicians make standardized, reliable, and accurate diagnoses of the 10 DSM-IV Axis II personality disorders as well as depressive personality disorder, passive-aggressive personality disorder, and personality disorder not otherwise specified. Now compatible with DSM-IV, the interview questions have been redesigned to reflect the subject's inner experience. This instrument begins with a brief overview that characterizes the subject's typical behavior and relationships and elicits information about the subject's capacity for self-reflection. It then considers each of the personality disorders in detail. The Questionnaire is a single-use personality questionnaire to be completed by the patient that can be used as a screening tool to shorten the interview. Bound separately, it is sold only with the Interview booklet. The Interview is a single-use booklet that is bound separately but used in conjunction with the Questionnaire. It contains the interview questions and provides space to record responses. At the conclusion of the Interview, the

Since the publication of the Institute of Medicine (IOM) report Clinical Practice Guidelines We Can Trust in 2011, there has been an increasing emphasis on assuring that clinical practice guidelines are trustworthy, developed in a transparent fashion, and based on a systematic review of the available research evidence. To align with the IOM recommendations and to meet the new requirements for inclusion of a guideline in the National Guidelines Clearinghouse of the Agency for Healthcare Research and Quality (AHRQ), American Psychiatric Association (APA) has adopted a new process for practice guideline development. Under this new process APA's practice guidelines also seek to provide better clinical utility and usability. Rather than a broad overview of treatment for a disorder, new practice guidelines focus on a set of discrete clinical questions of relevance to an overarching subject area. A systematic review of evidence is conducted to address these clinical questions and involves a detailed assessment of individual studies. The quality of the overall body of evidence is also rated and is summarized in the practice guideline. With the new process, recommendations are determined by weighing potential benefits and harms of an intervention in a specific clinical context. Clear, concise, and actionable recommendation statements help clinicians to incorporate recommendations into clinical practice, with the goal of improving quality of care. The new practice guideline format is also designed to be more user friendly by dividing information into modules on specific clinical questions. Each module has a consistent organization, which will assist users in finding clinically useful and relevant information quickly and easily.

This new edition of the practice guidelines on psychiatric evaluation for adults is the first set of the APA's guidelines developed under the new guideline development process. These guidelines address the following nine topics, in the context of an initial psychiatric evaluation: review of psychiatric symptoms, trauma history, and treatment history; substance use assessment; assessment of suicide risk; assessment for risk of aggressive behaviors; assessment of cultural factors; assessment of medical health; quantitative assessment; involvement of the patient in treatment decision making; and documentation of the psychiatric evaluation. Each guideline recommends or suggests topics to include during an initial psychiatric evaluation. Findings from an expert opinion survey have also been taken into consideration in making recommendations or suggestions. In addition to reviewing the available evidence on psychiatry evaluation, each guideline also provides guidance to clinicians on implementing these recommendations to enhance patient care.

The European College of Neuropsychopharmacology (ECNP) is a scientific and educational association which represents a variety of disciplines. The first ECNP congress took place in Copenhagen, May 1985, where a working group of European scientists within the field of psychopharmacology was elected to prepare a constituent ECNP congress in Brussels, 1987. Among the most active members of this group was Max Hamilton. At the second ECNP congress in Brussels Max Hamilton was elected as the first honorary member of the ECNP. When we received the message of his death we

decided at once to arrange a Max Hamilton memorial symposium at the third ECNP congress, May 1989, in Gothenburg, Sweden. This monograph contains the proceedings of the Max Hamilton symposium which was chaired by the editors. The opening lecture of the third ECNP congress was a Max Hamilton lecture: "A life devoted to science in psychiatry" which was presented by Sir Martin Roth. It seemed obvious to include Sir Martin's lecture as the opening article of this monograph. Although G .E. Berrios was unable to participate in the ECNP congress we have found it logical to include his manuscript on "The Hamilton Depression Scale and the Numerical Description of the Symptoms of Depression" as another personal contribution to Max Hamilton and his rating scales.

For many years, the need to develop valid tools to evaluate signs and symptoms of Parkinson Disease (PD) has been present. However the understanding of all intricacies of rating scales development was not widely available and the first attempts were relatively crude. In 2002, the Movement Disorders Society created a task force to systemize the measurement of Parkinson's Disease. Since then, the Task Force has produced and published several critiques to the available rating scales addressing both motor and non-motor domains of Parkinson Disease. Additionally the task force initiated a project to develop a new version of the UPDRS, the MDS-UPDRS. But none of this was made available in one convenient source. Until now. Rating Scales in Parkinson's Disease: Clinical Practice and Research is written for researchers from the medical and social sciences, and for health professionals wishing to evaluate the progress of their patients suffering from Parkinson's Disease. The book is both exhaustive in the description of the scales and informative on the advantages and limitations of each scale. As such, the text clearly guides readers on how to choose and use the

the needs of clinicians treating patients with depressive and anxiety disorders, this volume aims to bring together empirically validated assessment scales. In a concise and user-friendly format, *Assessment Scales in Depression and Anxiety* illustrates the assessment scales used in clinical trials and research studies; shows how to select an assessment scale and to decide which scale to use for a particular clinical situation; and provides sample assessment scales for clinicians to use in their practice.

Anyone who has ever been close to a seriously depressed child has undoubtedly been affected by the youngster's vulnerability, misery, and pain. Indeed, it is much like caring for a child who is in physical pain. For the child in the depths of depression, no activity is fun, nothing can be enjoyed, and no one can provide enough consolation or comfort. At times, the youngster may cry or whimper. There may be fits of defiance or rage and sometimes withdrawal into a numb, sullen silence. A child in this state tries the patience of parents and siblings. Remedies of every sort are tried, including gifts, punishments, bribes, lectures, pleading, and a host of others. Such efforts occasionally provide temporary

relief, but more often they seem to make matters worse. Commonly, there is an emotional wall of anger and frustration between a depressed child and other family members that may inevitably lead to further isolation and withdrawal. If too much time passes without their being helped, many depressed children and adolescents come to believe that suicide offers the only real relief for their pain. Currently, there is a Depression Awareness Week that includes free screening at participating health and mental health settings around the United States and is designed to identify depression in adults, suggesting that society's awareness of depression and psychiatric disorders is focused to a large extent on adults.

Anxiety, whether an illness or emotion, is a term with historical roots even in the Bible, but it was not popular until the modern age. Today, we can group, diagnose and treat several anxiety disorders to an extent, but the assessment of symptoms and severity, dealing with resistant conditions, new treatment modalities and specific patient population, such as children, are still the challenging aspects of anxiety disorders. This book intends to present anxiety disorders from a different view and discuss a wide variety of topics in anxiety from a

Mood disorders are a global health issue. National guidance for their detection and management have been published in the US and in Europe. Despite this, the rate at which depression is recognized and managed in primary and secondary care settings remains low and suggests that many clinicians are still unsure how to screen people for mood disorders. Against the backdrop of this problem, the editors of this volume have designed a book with a dynamic two-fold purpose: to provide an evidence-based overview of screening

methods for mood disorders, and to synthesize the evidence into a practical guide for clinicians in a variety of settings—from cardiologists and oncologists, to primary care physicians and neurologists, among others. The volume considers all important aspects of depression screening, from the overview of specific scales, to considerations of technological approaches to screening, and to the examination of screening with neurological disorders, prenatal care, cardiovascular conditions, and diabetes and cancer care, among others. This book is sure to capture the attention of any clinician with a stake in depression screening.
