Scientometrics--the quantitative study of scientific communication--challenges science and technology studies by demonstrating that organized knowledge production and control is amenable to measurement. First, the various dimensions of the empirical study of the sciences are clarified in a methodological analysis of theoretical traditions, including the sociology of scientific knowledge and neo-conventionalism in the philosophy of science. Second, the author argues why the mathematical theory of communication enables us to address crucial problems in science and technology studies, both on the qualitative side (e.g., the significance of a reconstruction) and on the quantitative side (e.g., the prediction of indicators). A comprehensive set of probabilistic entropy measures for studying complex developments in networks is elaborated. In the third part of the study, applications to S&T policy questions (e.g., the emergence of a European R&D system), to problems of (Bayesian) knowledge representations, and to the study of the sciences in terms of 'self-organizing' paradigms of scientific communication are provided. A discussion of directions for further research concludes the study.

World-renowned economist Klaus Schwab, Founder and Executive Chairman of the World Economic Forum, explains that we have an opportunity to shape the fourth industrial revolution, which will fundamentally alter how we live and work. Schwab argues that this revolution is different in scale, scope and complexity from any that have come before.

Characterized by a range of new technologies that are fusing the physical, digital and biological worlds, the developments are affecting all disciplines, economies, industries and governments, and even challenging ideas about what it means to be human. Artificial intelligence is already all around us, from supercomputers, drones and virtual assistants to 3D printing, DNA sequencing, smart thermostats, wearable sensors and microchips smaller than a grain of sand. But this is just the beginning: nanomaterials 200 times stronger than steel and a million times thinner than a strand of hair and the first transplant of a 3D printed liver are already in development. Imagine "smart factories" in which global systems of manufacturing are coordinated virtually, or implantable mobile phones made of biosynthetic materials. The fourth industrial revolution, says Schwab, is more significant, and its ramifications more profound, than in any prior period of human history. He outlines the key technologies driving this revolution and discusses the major impacts expected on government, business, civil society and individuals. Schwab also offers bold ideas on how to harness these changes and shape a better future--one in which technology empowers people rather than replaces them; progress serves society rather than disrupts it; and in which innovators respect moral and ethical boundaries rather than cross them. We all have the opportunity to contribute to developing new frameworks that advance progress.

The Balanced Scorecard translates a company's vision and strategy into a coherent set of performance measures. The four perspectives of the scorecard--financial measures, customer knowledge, internal business processes, and learning and growth--offer a balance between short-term and long-term objectives, between outcomes desired and performance drivers of those outcomes, and between hard objective measures and softer, more subjective measures. In the first part, Kaplan and Norton provide the theoretical foundations for the Balanced Scorecard; in the second part, they describe the steps organizations must take to build their own Scorecards; and, finally, they discuss how the Balanced Scorecard can be used as a driver of change.

En 2019 el desempeño del comercio mundial de bienes sería el peor desde la crisis financiera. En esta edición de Perspectivas del Comercio Internacional de América Latina y el Caribe se analiza dicho fenómeno, así como las crecientes tensiones comerciales y las repercusiones en el comercio regional. La fuerte desaceleración del comercio mundial responde tanto a la acumulación de barreras comerciales desde 2018 como a otros factores de más larga data. Entre estos se destacan la menor demanda mundial, la creciente sustitución de importaciones por producción nacional en algunas economías, la menor proporción de la producción china que se destina a la exportación, el retroceso de las cadenas globales de valor y la irrupción de nuevas tecnologías que causan un impacto en la naturaleza misma del comercio. En el capítulo II se analiza la forma en que el comercio internacional puede hacer un mayor aporte a la sostenibilidad ambiental. Los vínculos entre comercio y medioambiente se han hecho más visibles desde los años noventa, como muestra el aumento de las controversias comerciales vinculadas con aspectos ambientales y la creciente incorporación de capítulos ambientales en los acuerdos comerciales. Por último, en el capítulo III se examina la situación de la infraestructura y la logística, aspectos clave para el comercio internacional y la producción. Se concluye destacando la necesidad de reexaminar las políticas públicas en materia de concesiones de infraestructura económica y el rol central de la acción regulatoria del Estado, especialmente en el ámbito de la competencia.
