Cancer is a dreadful human disease, increasing with changing lifestyle, nutrition, and global warming. Its treatments do not have potent medicine as the currently available drugs results in severe side effects. Past activities in this area focused on the natural products derived from medicinal plants. According to the WHO, 80% of the world's population primarily those from developing countries rely on plant-derived medicines for the health care. Over the past few decades, significant efforts have been made, jointly by pharmaceutical and academic institutions, to isolate and identify new marine-derived natural products. With the advancement of technology and methodology in this area, numerous new compounds have been isolated and several novel anticancer compounds are under clinical investigations. The ocean biomass, covering two-third of the earth, with huge unexplored natural product offers enormous scope and presents an effective alternative in natural product drug discovery. The uniqueness in oceanic mega-diversity is due to spatial as well as temporal competition along with unique habitat with extreme pressure, temperature, and saline conditions. As a result of this, marine organisms have adapted and evolved themselves successfully since centuries in these conditions by producing molecules which are unique in structures, biosynthesis, and function. This "chemical adaptations" is an excellent source of novel chemical entities which is absent in land-based organisms. The past decade has seen more than 10,000 compounds isolated from marine sources which have dramatically increased the number of preclinical anticancers drug under evaluation, and over 300 patents on bioactive natural products from marine sources were granted during this tenure. Efforts, in this direction, became more serious and focused with National Cancer Institute, USA taking a lead role. By collaborative interactions between pharmaceutical companies and research organization, numerous drug-like molecules with several of them having clinical and preclinical potential were discovered. Ecteinascidin-743/ET-743 from Caribbean tunicate and Didemnin and Aplidine from *Aplidium albicans* are some of the successful examples. Sterols and dietary fibers from seaweeds also hold immense potential. However, investigation of the marine floras chemical entities as drug-like molecule is still in its embryonic stage. The present chapter showcases the past research and reviews the baseline data for promoting further research in this field.

"The Dictionary of Marine Natural Products is a comprehensive database containing over 30,000 compounds. It is a subset of the Dictionary of Natural Products (DNP) database. ... entries referring to marine natural products were carefully checked and reviewed and enhanced with a considerable amount of additional information relating to their natural occurrence. ... The compounds present in the Dictionary have been classified under the following major headings, which are described in more [detail] in the Structural Types section below, available as a PDF file. (There are obvious overlaps between the categories.): aliphatic natural products, carbohydrates, oxygen heterocycles, simple aromatic natural products, terpenoids, steroids, aminoacids and peptidesthat, lkaloids, polypyrroles, biosynthetic information on these compound classes can also be found in the Structural Types section. Taxonomic information on the organisms and their metabolites is covered in the Classification of Organisms section available as a PDF file. The definition of a marine natural product is imprecise. The coverage of this Dictionary in terms of 'mainstream' natural products is intended to be comprehensive and as far as can be determined."--Introduction screen (viewed on Sept 29, 2010).

Access to genetic resources and Benefit Sharing (ABS) has been promoted under the Convention on Biological Diversity, with the aim of combining biodiversity conservation goals with economic development. However, as this book shows,

since its inception in 1992, implementation has encountered multiple challenges and obstacles. This is particularly so in the marine environment, where interest in genetic resources for pharmaceuticals and nutrients has increased. This is partly because of the lack of clarity of terminology, but also because of the terms of the comprehensive law of the sea (UNCLOS) and transboundary issues of delineating ownership of marine resources. The author explains and compares relevant provisions and concepts under ABS and the law of the sea taking access, benefit sharing, monitoring, compliance, and dispute settlement into consideration. He also provides an overview of the implementation status of ABS-relevant measures in user states and identifies successful ABS transactions. A key unique feature of the book is to illustrate how biological databases can serve as the central scientific infrastructure to implement the global multilateral benefit sharing mechanism, proposed by the Nagoya Protocol. The research for this book was supported by both the Bremen International Graduate School for Marine Sciences (GLOMAR) and the International Research Training Group INTERCOAST – Integrated Coastal Zone and Shelf-Sea Research.

Thus, the apolar compounds are divided in linear and branched alkanes followed by alicyclic compounds and aromatic and heterocyclic molecules, and, in particular, the geoporphyryns. The polar molecular fossils contain as functional groups or constituent units ethers, alcohols, phenols, carbonyl groups, flavonoids, quinones, and acids, or are polymers like kerogen, amber, melanin, proteins, or nucleic acids. The final sections discuss the methodology used and the fundamental processes encountered by the biomolecules described, including diagenesis, catagenesis, and metagenesis. The second contribution covers the distribution of phthalides in nature and the findings in the structural diversity, chemical reactivity, biotransformations, syntheses, and bioactivity of natural and semisynthetic phthalides.
