The Roundtable on Health Literacy brings together leaders from academia, industry, government, foundations, and associations and representatives of patient and consumer interests who work to improve health literacy. To achieve its mission, the roundtable discusses challenges facing health literacy practice and research and identifies approaches to promote health literacy through mechanisms and partnerships in both the public and private sectors. To explore the aspects of health literacy that impact the ability of patients to understand and follow discharge instructions and to learn from examples of how discharge instructions can be written to improve patient understanding of- and hence compliance with-discharge instructions, the Roundtable on Health Literacy held a public workshop. The workshop featured presentations and discussions that examined the implications of health literacy for discharge instructions for both ambulatory and inpatient facilities. Facilitating Patient Understanding of Discharge Instructions summarizes the presentations and discussions of the workshop. This report gives an overview of the impact of discharge instructions on outcomes, and discusses the specifics of inpatient discharge summaries and outpatient after-visit summaries. The report also contains case studies illustrating different approaches to improving discharge instructions.

Endoscopy procedures are frequently conducted in the United States. This project aims to enhance patient satisfaction regarding endoscopy discharge instructions. The population studied were adults who were having either a colonoscopy or esophagogastroduodenoscopy (EGD) as an outpatient. The total number of adults were 406, ages 21 to 86 years old. There were 228 females and 178 males. Patient satisfaction data was collected pre- and postintervention. The intervention was carried out in the preoperative endoscopy area at a small community hospital located in Hamilton, Ohio. The project applied six-questions in a Likert scale survey as one of the data collection tools. There were 193 preintervention patients whose data were analyzed from September 3 to 30, 2019, who received discharge instructions in the post anesthesia care unit (PACU). A total of 213 postintervention patients from October 1 to 30, 2019, received discharge instructions in the preoperative area. The percentage of patients who stated they understood the discharge instructions preintervention was 93.7% compared to 96.4% of postintervention patients who indicated they understood the discharge instructions. The Outpatient and Ambulatory Surgery Consumer Assessment of Hospital Providers and System (OAS CAHPS) results were analyzed from October 2018 through October 2019. The lowest overall patient satisfaction results from the OAS CAHPS regarding discharge instructions preintervention was 65%, whereas postintervention increased to 97%. One of the lessons learned from this project is to have only a few dedicated nurses in the preoperative endoscopy area that are trained and well versed in teaching discharge instructions. Patients who are well educated and understand the discharge information are likely to be more satisfied and care for themselves.

According to Transforming Health Care Scheduling and Access, long waits for treatment are a function of the disjointed manner in which most health systems have evolved to accommodate the needs and the desires of doctors and administrators, rather than those of patients. The result is a health care system that deploys its most valuable resource--highly trained personnel--inefficiently, leading to an unnecessary imbalance between the demand for appointments and the supply of open appointments. This study makes the case that by using the techniques of systems engineering, new approaches to management, and increased patient and family involvement, the current health care system can move forward to one with greater focus on the preferences of patients to provide convenient, efficient, and excellent health care without the need for costly investment. Transforming Health Care Scheduling and Access identifies best practices for making significant improvements in access and system-level change. This report makes recommendations for principles and practices to improve access by promoting efficient scheduling. This study will be a valuable resource for practitioners to progress toward a more patient-focused "How can we help you today?" culture.

Many patients who present to district (first-referral) level hospitals require surgical treatment for trauma obstetric abdominal or orthopaedic emergencies. Often surgery cannot be safely postponed to allow their transfer to a secondary or tertiary-level hospital but many district hospitals in developing countries have no specialist surgical teams and are staffed by medical nursing and paramedical personnel who perform a wide range of surgical procedures often with inadequate training. the quality of surgical and acute care is often further constrained by poor facilities inadequate low-technology apparatus and limited supplies of drugs materials and other essentials. the mission of the team responsible for Clinical Procedures in the World Health Organization Department of Essential Health Technologies (EHT) is to promote the quality of clinical care through the identification promotion and standardization of appropriate procedures equipment and materials particularly at district hospital level. WHO/BCT has identified education and training as a particular priority especially for non-specialist practitioners who practise surgery and anaesthesia. It has therefore developed Surgical Care at the District Hospital as a practical resource for individual practitioners and for use in undergraduate and postgraduate programmes in-service training and continuing medical education programmes. the manual is a successor of three earlier publications that are widely used throughout the world and that remain important reference texts:

General Surgery at the District Hospital (WHO 1988) Surgery at the District Hospital: Obstetrics Gynaecology Orthopaedics and Traumatology (WHO 1991) Anaesthesia at the District Hospital (WHO 1988; second edition 2000). This new manual draws together material from these three publications into a single volume which includes new and updated material as well as material from Managing Complications in Pregnancy and Childbirth: a Guide for Midwives and Doctors (WHO 2000). Link to the full training tool kit CD-ROM: WHO Integrated Management for Emergency and Essential Surgical Care (IMEESC) Toolkit CD-ROM Surgical Care at the District Hospital is a compact but comprehensive outline of modern surgical care focusing on fundamental precepts and practical techniques. The illustrations are clear instructive and appropriate. The authors are to be commended on a much improved new edition. Barry J. The transformation in the health care industry, begun over a decade ago, will continue well into the 21st century. And the dominant theme in the new millennium is likely to be collaborative practice and outcome s-based health care delivery. A collection of the most current and innovative presentations in path-based, collaborative practices, this book focuses on the design, implementation and analysis of outcomes for the heavy volume DRGs. For each DRG, the authors present two to three standard clinical pathways, and then show how those pathways can be manipulated to alter outcomes. *Health Care Outcomes* covers topics in Respiratory, Neonatal/Pediatric, General Surgery, Orthopaedic, and Geriatric Care. A comprehensive collection of critical pathways and outcomes maps being used by leading hospitals and health care agencies around the country, this is an important reference for developing path-based care models, or revising critical paths and outcomes maps.

This new, comprehensive reference not only brings readers the most up-to-date, evidence-based approaches to hospital-based pediatric care, but also covers issues related to staffing a unit; financial, legal, and ethical practices; and how to maintain effective communication between referring providers and consulting staff.

This book provides a comprehensive review of the, challenges, risk, stratification, and approaches and techniques needed to improve pain control in ambulatory surgery centers (ASCs). It addresses not only the management of acute perioperative pain but also describes modalities that could potentially reduce the risk of evolution of acute pain into chronic pain, in addition to weaning

protocols and follow ups with primary surgical specialties and pain physicians as needed. Organized into five sections, the book begins with the foundations of managing ASCs, with specific attention paid to the current opioid epidemic and U.S. policies relating to prescribing opioids to patients. Section two and three then explore facets of multimodal analgesia and non-operating room locations, including the use of ultrasounds, sedation in specific procedures, regional anesthesia, ketamine infusions, and the management of perioperative nausea and intractable pain in outpatient surgery. Section four examines the unique challenges physicians face with certain patient demographics, such as the pediatric population, those suffering from sleep apnea, and those with a history of substance abuse. The book closes with information on discharge considerations, ambulatory surgery protocols, recovery room protocols, and mandatory pain management services. An invaluable reference for all health personnel and allied specialties, *Pain Control in Ambulatory Surgery Centers (ASCs)* meets the unmet need for a resource that covers optimum pain control in patients undergoing outpatient surgery as well as the urgent ASCs challenges that are presented on an immense scale with national and international impact. .
