Young Anon, who marches to the beat of a different drummer in galoshes to protect himself from radiation, touches the lives of all around him, resulting in disillusionment, loss, love, and more than a few surprises.

Describes eight cross-cut saw maintenance tools that have been redesigned by the Missoula Technology and Development Center.

Describes a tool used to set (slightly bend) a tooth on a crosscut saw. A crosscut saw's teeth are set alternately to the right and left away from the plane of the saw blade. The set produces a kerf or cut that is wider than the saw blade, helping to prevent the blade from getting stuck. The raker teeth that pull wood from the cut are not set. The tooth-setting tool allows a hammer to be used to bend a tooth against the tool's anvil. During a test, each blow from a 1-pound hammer moved the cutter tooth about 0.001 inch. A spider or dial indicator gauge is used to make sure the set is correct for the type of wood being cut and the type of saw being used. The typical tooth set for Forest Service applications is about 0.012 to 0.015 inch.

Why are golf assistants called caddies? Why do the British drive on the left and North Americans on the right? Why is football played on a "gridiron," and a leg injury called a "Charlie horse"? The answers to these questions and the origins of hundreds of other expressions and customs are brought together in this fascinating collection of the history behind everyday words and routines. With all the conciseness of his original radio scripts, Doug Lennox "cuts to the quick" in telling you the things you always wanted to know.

Describes a tool used to allow a crosscut saw to cut up from below a log. A log may have fallen in such a way that a cut from the top closes on the saw (binds), while a cut from the bottom may open, allowing the saw to operate freely. Underbucking tools are no longer commercially available. Traditional underbucking tools were large and heavy, making them unsuitable for use by wilderness and backcountry crosscut sawyers. The USDA Forest Service's Missoula Technology and Development Center has developed an underbucking tool that is inexpensive, lightweight, and easily fabricated. This Tech Tip includes a parts list, instructions, and a mechanical drawing that will allow someone to build the underbucking tool. Parts cost less than \$25.

The 18th century was a wealth of knowledge, exploration and rapidly growing technology and expanding record-keeping made possible by advances in the printing press. In its determination to preserve the century of revolution, Gale initiated a revolution of its own: digitization of epic proportions to preserve these invaluable works in the largest archive of its kind. Now for the first time these high-quality digital copies of original 18th century manuscripts are available in print, making them highly accessible to libraries, undergraduate students, and independent scholars. Medical theory and practice of the 1700s developed rapidly, as is evidenced by the extensive collection, which includes descriptions of diseases, their conditions, and treatments. Books on science and technology, agriculture, military technology, natural philosophy, even cookbooks, are all contained here. ++++ The below data was compiled from various identification fields in the bibliographic record of this title. "Hartnett again captures the ineffable fragility of childhood in this keenly observed tale." — Publishers Weekly (starred review) Nine-year-old Adrian watches his world closely, but there is much he cannot understand. He does not, for instance, know why three neighborhood children might set out to buy ice cream one summer's day and never be seen again...In a suburb that is no longer safe and innocent, in a broken family of self-absorbed souls, Sonya Hartnett sets the story of a lone little boy — unwanted, unloved, and intensely curious — a story as achingly beautiful as it is shattering. Describes how to inspect and maintain a hardhat, one of the most important pieces of personal protective safety equipment. The hardhat has three parts: the shell, suspension system, and chinstrap. The shell, commonly made from a thermoplastic (such as polycarbonate), protects the wearer's head from penetration and impact injuries. The suspension system is designed to help absorb the impact of a blow to the wearer's head. The chinstrap is designed to keep the hardhat in place when it might otherwise shift or fall off. A simple hardhat field inspection involves compressing the shell from both sides about 1 inch with your hands and releasing the

pressure without dropping the shell. The shell should return to its original shape quickly, exhibiting elasticity. If the shell being tested does not have as much elasticity as a new shell, or if the shell cracks, it should be replaced immediately.
