An overview of the optical effects in solids, addressing the physics of various materials and their response to electromagnetic radiation. The discussion includes metals, semiconductors, superconductors, and insulators. The book begins by introducing the dielectric function into Maxwell's macroscopic equations and finding their plane-wave solution. The physics governing the dielectric function of various materials is then covered, both classically and using basic quantum mechanics. Advanced topics covered include interacting electrons, the anomalous skin effect, anisotropy, magneto-optics, and inhomogeneous materials. Each subject begins with a connection to the basic physics of the particular solid, after which the measurable optical quantities are derived. It allows the reader to connect measurements (reflectance, optical conductivity and dielectric function) with the underlying physics of solids. Methods of analysing experimental data are addressed, making this an ideal resource for students and researchers interested in solid state physics, optics, and materials science.

"This book is structured in seven chapters. Chapter 1 discusses glass science and structures of inorganic glasses, which are commonly used for photonic devices, including oxide, fluoride, chalcogenide and mixed anion glasses. Chapter 2 covers the important thermal, viscosity and physical properties of glasses which, by nucleation and crystal growth processes can be engineered for photonic device applications. In Chapter 3, bulk glass fabrication using melting and casting and sol-gel techniques are discussed along with the fabrication principles of glass-ceramic materials, sol-gel formation and sol-gel based glass fabrication. Chapter 4 introduces the standard geometrical optics for fibre optics, Maxwell's equation for modal analysis and its importance in fibre and waveguide optics. It concludes with a detailed discussion on refractive index and its dependence on compositions, density, temperature and stress. The relationship of these properties in controlling bulk optical properties is especially emphasized. The main emphasis of Chapter 5 is on the methods of thin film fabrication using physical and chemical vapour deposition and on pulsed laser deposition including ion implantation techniques. Chapter 6 starts with the classical radiative transition theory based on dipole models, and then explains the concept of dipoles and electron-phonon coupling. Emphasizing various quantum mechanical rules, it then discusses the radiative, non-radiative, energy transfer and upconversion processes. Finally, chapter 7 covers the photonic device applications of

inorganic glasses, fibres and waveguides and concludes with a short discussion on the emerging opportunities in future for inorganic glasses"--

There are a number of very good books available on linear algebra. However, new results in linear algebra appear constantly, as do new, simpler, and better proofs of old results. Many of these results and proofs obtained in the past thirty years are accessible to undergraduate mathematics majors, but are usually ignored by textbooks. In this book, the author provides the basics of linear algebra, with an emphasis on new results and on nonstandard and interesting proofs. The book features about 230 problems with complete solutions. It can serve as a supplementary text for an undergraduate or graduate algebra course.
