Written to help identify major gaps in our knowledge of how gender and age affect psychiatric diagnoses and to stimulate much-needed research to fill these gaps, *Age and Gender Considerations in Psychiatric Diagnosis* serves as both a valuable short-term source for the DSM-V Task Force and its disorder-specific workgroups, and a long-term guide for future studies that will contribute to revised psychiatric classifications in these three areas. Here, 47 experts present findings in three areas of psychiatric research that historically have been neglected but rightfully have received increasing attention in recent years and thus are worthy of investigation into their clinical features, etiology, and course: 1. Significant gender differences in prevalence, symptom profiles, and risk factors for mental disorders, including neurodevelopmental, neurophysiological, and environmental factors for men and women that cut across diagnostic categories—for example, the critical importance of gender in how psychiatric illness develops and presents; DSM's approach to gender to date; and relevant research findings and gaps in the epidemiology, etiology, and pathophysiology of disorders and the gender-related expression of psychopathology, including the controversial and complex question of whether DSM should have different diagnostic criteria for men and women. 2. Mental disorders in infancy and early childhood, including diagnosis and measurement of psychopathology; PTSD and social and cognitive factors related to the experience of stress; reactive attachment disorder (unique in part because of its specificity to early childhood); mood and anxiety disorders and difficulties in diagnosis; sleep disorders, including two new disorders, Night-Waking Dysomnia and Sleep-Onset

Dysomnia; feeding disorders, including the need to address overeating and overfeeding (especially given the alleged U.S. epidemic of obesity); early childhood manifestations of behavior disorders; and early symptoms and diagnosis of autism. 3. Mental disorders in the elderly, such as dementia and depression, once considered normal consequences of aging but now understood to represent mental disorders, including the need to identify specific brain structure abnormalities, biomarkers, and the many contributing biological, psychosocial, and environmental factors of mental illness in late life and to understand their roles in the elderly to better diagnose and monitor disease progression. Written for clinicians and researchers alike, this thought-provoking compendium contributes critical information that helps enhance our understanding of the causes of mental disorders, develop effective preventive and treatment interventions, and inform future editions of DSM and ICD.

Currently, there are two types of pediatric disorder books available: high level technical books geared toward pediatric specialists, and self-help books for parents. The technical books cover diagnosis and treatment, while the self-help books cover general problems, are single authored, and speak little to the research of any given disorder. This volume consists of focused articles from the authoritative Encyclopedia of Infant and Early Childhood Development that cover the research information on common disorders in age 0-3. Topics include those most typically occurring, making them of great interest to both specialists and nonspecialists. Disorders and dysfunction of a variety of types are discussed, whether cognitive, social, emotional, or physiological. Coverage includes asthma, allergies, colic, bedwetting, diarrhea, genetic disorders, SIDS and learning disabilities, and provides an essential, affordable reference for researchers in developmental psychology, as well as allied health fields. Written at a level for general understanding—allows for easy and quick grasp of information to both specialists and non specialists alike Covers disorders across many systems (neurological, immunological etc) providing quicker access to info that would normally be dispersed across a wide literature Written by research experts ensuring accuracy that is sometimes lacking in non-specialist books Covers disorders, dysfunctions, and abnormal development in one place saving time looking at multiple sources for these related items

Now in a fully revised and updated second edition, this authoritative text integrates state-of-the-art theory and empirical research on a wide range of child and adolescent disorders. Featuring contributions from leading scholars and clinicians, the volume is notable for its comprehensive coverage of the biological, psychological, and social-contextual determinants of childhood problems. Each chapter focuses on a specific disorder, describing its characteristics, developmental course, and epidemiology; outlining current diagnostic and classification schemes; identifying risk and protective factors; and discussing implications for prevention and treatment. Including a new chapter on adolescent substance use disorders, the second edition has been updated throughout to reflect important advances in the field. Incorporated is emerging knowledge in the areas of neurobiology, genetics, developmental psychology, and emotions, as well as new findings on sex differences in psychopathology and long-term outcomes for children at risk.

Delays in development, as well as in growth, can occur when a feeding disorder arises. Irene Chatoor, MD, a world-renowned

specialist in feeding disorders at Children's National Medical Center in Washington, DC, offers clinical guidelines for comprehensive diagnosis and treatment of feeding disorders in infants and toddlers. Grounded in the latest research and contemporary practice, the author discusses the consequences of early feeding problems and reviews relevant terminology, etiological factors, and how to distinguish serious feeding disorders from transient and milder feeding difficulties. The book also includes Parent Information Outlines about the feeding disorders which professionals can use as handouts for patient's families. The volume is authored by a colorectal surgeon with long-standing clinical and scientific experience and is devoted to the management of complications following surgery of the anorectum and the pelvic floor. It is aimed not only at general surgeons, perineologists and, of course, proctologists, but also at gastroenterologists, endoscopists, radiologists and physiotherapists, i.e. those who may be involved in both diagnosis and cure whenever an adverse event, either unpredictable or potentially preventable, causes an intra- or postoperative, early or late, mild or life-threatening complication. Severe bleeding, dehiscence, perforation, anorectal stricture, fecal incontinence, and even caval vein thrombosis, fatal Fournier gangrene and pneumomediastinum may occur after anal surgery. The incidence, pathogenesis prevention and treatment of such events are discussed in detail in 10 chapters with 30 tables, 200 illustrations and more than 1000 references. Both conventional procedures and recent innovations are reported. "Unforgettable clinical cases (complications with litigation)" and "Tips and Tricks" are sections increasing the appeal of this book. The approach is "evidence-based" and holistic, focusing on anorectal problems while taking into consideration whole body-mental unity—showing, for example, that a non-healing perineal wound may be due to hypo-pituitarism, and failure after a re-intervention may be related to psychological distress.

This is the third edition of a comprehensive study of the neuronal disorders of the lower gastrointestinal tract in children. Important new studies and progress in research on bowel motility and motility disorders are covered in detail as well as new aspects concerning the embryology, functional anatomy of the enteric nervous system. In particular new insights have been received from the studies in the genetics of Hirschsprung's disease. Special emphasis is laid on new surgical techniques, especially on the laparoscopic approach in combination with Soave's or Duhamel's technique.

Within a developmental framework, this book presents a range of effective approaches to treating early relationship difficulties and promoting more sensitive and responsive parenting. Clinicians are guided to understand the different types of problems that parents have with infants and to determine how a given family might best be served--whether by addressing health concerns that are affecting infant behavior, modifying parental beliefs or expectations, or targeting key caregiving skills. Leading experts detail their respective therapeutic models in a practical, clinician-friendly format, including intervention guidelines and illustrative case material. Special topics covered include working with families of infants with special needs and with those at risk for child maltreatment.

Dramatic improvement in imaging techniques (3D ultrasonography, dynamic magnetic resonance) allows greater insight into the complex anatomy of the pelvic floor and its pathological modifications. Obstetrical events leading to fecal and urinary incontinence in women, the development of pelvic organ prolapse, and mechanism of voiding dysfunction and obstructed defecation can now be accurately assessed, which is fundamental for appropriate treatment decision making. This book is written for gynecologists, colorectal surgeons, urologists, radiologists, and gastroenterologists with a special interest in this field of medicine. It is also relevant to everyone who aspires to improve their understanding of the fundamental principles of pelvic floor disorders.

The Silent Epidemic addresses a critical public health problem in America – the leading preventable cause of birth defects, neurodevelopmental disorders, and intellectual disability: prenatal alcohol exposure. From her work in community health, forensic psychiatry, and private practice, Dr. Rich provides insight into the prevalence of neurodevelopmental disorder associated with prenatal alcohol exposure (ND-PAE) among juveniles accused of violent crimes, in neighborhoods where America’s “least valued” citizens reside, and even in upper middle class communities. The problem develops as early as the first three weeks of pregnancy, when many women are unaware that they are pregnant. With appropriate diagnosis and treatment, affected individuals can avoid a lifetime of lost potential from substance use disorders, incarceration, unemployment, and homelessness.

The book, a research paper, reveals and analyzes misconceptions about the Spiritual Baptist Faith, an indigenous religious expression of Christianity in Trinidad and Tobago. It highlights the academic bias to the Faith, which is maligned and misunderstood because of its humble beginnings amidst ex-plantation slaves of African descent and its history of persecution and prosecution by the colonial authorities of the early 20th century. The research provided answers to some of the troubling questions about the Faith and served as the source for the book My Faith, Spiritual Baptist Christian by the same author.
