Perspectives For Geothermal Energy In Europe Ruggero Bertani, 2017-03-24 The potential for energy transformation from geothermal heat is limitless. For millennia natural sources of this energy, in the form of thermal springs, have been used by populations for heating, cooking and bathing. Modern-day usage has been extended to electricity generation from binary cycle power plants, heat extraction from geothermal heat pumps and use in greenhouses for industrial crop growing. *Perspectives for Geothermal Energy in Europe* highlights the status of geothermal energy in countries where natural sources of this energy are available. It concludes with a presentation of current geothermal policy and regulations within Europe, and discussion of how this fits in with the EU Energy and Climate Framework. Suitable for students, academics and practitioners in the fields of energy studies, geology and the earth sciences, electrical engineering and environmental economics, this book is the first comprehensive review of the practicalities of geothermal extraction and use in Europe.

Geothermal Energy and Society Adele Manzella, Agnes Allansdottir, Anna Pellizzone, 2018-07-23 This book addresses the societal aspects of harnessing geothermal resources for different uses, such as power production, heating and cooling. It introduces a theoretical framework for a social scientific approach to the field, and presents a preliminary collection of empirical case studies on geothermal energy and society from across the world. By providing a conceptual and methodological framework to the study of geothermal energy and societies, it brings together information and analyses in the field that to date have been sparse and fragmented. The contributors explore the diverse aspects of the relationship between the harnessing of geothermal resources and the societies and local communities in which these developments take place. After introducing geothermal technologies, renewable energy concepts as well as their social and policy context and the regulative and environmental aspects of geothermal energy, the book analyzes and discusses twelve global case studies, and compares the social engagement tools applied with those used in other sectors. Of interest to researchers from a range of disciplines who wish to explore the issues surrounding energy and society, it is also a valuable resource for geothermal experts and postgraduate students wish to study the field in greater detail.

Liberalizing European Energy Markets Finn Roar Aune, 2008-05-30 Based on a state-of-the-art detailed numerical

simulation model, this volume presents an economic analysis of the main effects of liberalizing the electricity and natural gas markets across Western Europe.

Advances in European Geothermal Research A.S. Strub,P. Ungemach,2012-12-06 The first crisis in energy prices was undoubtedly a strong stimulus for the involvement of the Commission of the European Communities in research and development on alternative energy sources. Indeed, the need to overcome difficulties faced by the Community as a whole, particularly those resulting from its severely unbalanced energy supply, made a common Community approach seem especially apt. This reasoning also applies to energy R&D, bearing in mind that responses to the crisis should be not only political or economic, but also scientific. Four years have passed since the decision of the Council of Ministers to launch the first Community Energy Research and Development Programme, dealing with geothermal energy, solar energy, hydrogen production and utilization, energy conservation and energy systems analysis. A seminar on geothermal energy was held two years ago to report on work in progress at the half-way stage of the four-year programme. The second international seminar, reported in this volume, was arranged so as to provide an opportunity to examine the final outcome of this Community investment in research in geothermal energy. This proceedings volume therefore has two main aims: - to present an evaluation of the results of the Community geothermal programme, by means of 83 formal reports describing the individual research programmes; - to show how the Community research programme fits into the overall context of national and international research on geothermal energy, by including the presentations of six guest speakers who introduced the sessions and gave keynote addresses.

Management of Civic Energy and the Green Transformation Anna Brzozowska,Piotr Maśloch,Grzegorz Maśloch,2023-05-11 An increase in the global demand for energy, combined with an increase in the price of energy and energy products, has advanced the growing interest in renewable energy technologies and the wide implementation of renewable energy sources (RES). Member States of the European Union have been global leaders in the use of renewable energy and in the transition to new technologies. Management of Civic Energy and the Green Transformation: A Case Study of Poland examines the current issues of transitioning from traditional energy sources to newer, renewable energy sources,

while balancing supplies, and working synergistically with existing, conventional sources. Features: Offers a balanced blend of theory and practice of development economics for renewable energy implementation Presents a case study of how Poland is working towards their energy transition, and provides other examples and recent statistical data from other European Union countries Analyses the legal and systemic conditions supporting the development of renewable energy systems and offers direction on the potential for the green development of the civic energy sector

Geothermal Energy, 2019 The objective of this report is to highlight recent technology market trends and developments in the field of geothermal energy and to explore the medium and long-term perspective of the geothermal energy technology markets with a focus on Europe. The report highlights the relative competitive position of the EU geothermal industries. This report builds on established JRC work [JRC 2015a, JRC 2015b, Magagna et al. 2017] in the area of geothermal energy and includes results from additional modelling work performed in the framework of the LCEO. It also provides an outlook for future deployment of geothermal energy through modelling and sensitivity analysis of both techno-economic and external drivers. The report is structured as follows: section 2 addresses the technology status and trends, section 3 the current deployment situation and market, section 4 looks at the market outlook and section 5 provides conclusions and recommendations.

Geothermal Heating R. Harrison, N. D. Mortimer, O. B. Smarason, 2013-10-22 To date all books on geothermics have emphasized its use for generating electricity, with applications of lower grade resources for direct heating meriting only a brief chapter. This book brings together research from a range of scientific journals and 'grey' literature to produce the first comprehensive text on geothermal heating. Economics form an important part of the book. It provides a step by step analysis of the various ways in which thermal waters can be used to provide space heating and of the advantages and disadvantages of different approaches. The final section of the book provides case studies of 31 geothermal heating schemes in France, USA and Iceland.

State of the Art in Deep Geothermal Energy in Europe Johanna Fink, Elisa Heim, Norbert Klitzsch, 2022-04-21 Since nearly 50 % of Europe's energy demand is in the heating and cooling sector, it is expected that geothermal energy will play an important role in the transition to a decarbonized energy system. However, deep geothermal energy is currently harvested mainly from areas with very favorable geothermal conditions. As these areas are geographically limited, the use of geothermal energy in less favorable regions is essential for unleashing the full potential of geothermal energy, since they make up the majority of the total geothermal potential in Central Europe. Motivated by the growing interest in deep

geothermal energy among, e.g., energy companies and communities, this text reviews the state of the art in deep geothermal energy with focus on direct heating in geothermally less favorable regions. It provides an overview of technologies used to generate heat from the deep underground and discusses main technical and non-technical risks associated with deep geothermal projects. The text addresses readers with an interest in geothermal energy but does not require a background in geoscience or engineering sciences. It is suitable as textbook for Geothermal Energy courses for undergraduate students from different disciplines.

Local Energy Communities Gilles Debizet, Marta Pappalardo, Frédéric Wurtz, 2022-09-06 This book draws on social science analysis to understand the ongoing dynamics within and surrounding local energy communities in reliably electrified countries: Belgium, Canada, Colombia, France, Germany, India, the Netherlands, Spain, Switzerland and the United Kingdom. It offers a comprehensive overview of recent results and thus outlines a diversity of drivers and levers for scaling up energy communities or, at least, local energy sharing. Analysing the main types of energy communities such as collective self-consumption, citizen cooperatives and peer-to-peer digital platforms, the book does not only raise new questions for social scientists, but also offers a comprehensive overview for all those contributing to the circular economy and the decentralization of energy production in inhabited areas where energy consumption is concentrated. This book provides input for the ongoing debates in many European countries implementing the national law on the European directives for energy communities. Furthermore, without evading the antagonism between cooperative and market approaches, or the contradictions between different issues, the book outlines the innovative decision-making tools that can facilitate the development of local energy production and sharing systems. As well as being of interest to postgraduates and researchers in the field of energy studies, this book will be vital to energy professionals looking to support local energy communities' decision-making and design, who wish to consider sociological, organizational and territorial dimensions.

An Investigation of the Sensitivity of the Economic Appraisal of Geothermal Energy Resources to Energy Price Rises R. Harrison, N. D. Mortimer, M. J. Lockwood, 1982 A procedure has been developed to assess the prospects for using low-temperature geothermal resources in the United Kingdom and Europe, for domestic heating under changing economic conditions. This report describes the procedure which consists of routines for investigating reservoir characteristics, well drilling costs, heating system operation and costs, and techniques of financial appraisal for the complete project. Sample data are used to test and validate the procedure. The basic sensitivity of costs to fuel price rises is examined by using energy analysis to determine the relative importance of energy inputs. Both unit costs of heat produced at the wellhead and of heat finally delivered to dwellings in a complete scheme are calculated. These results are used to examine the effect of resource parameters, operating conditions and economic factors, including fuel and general price inflation, on the economics of geothermal heating schemes. Total unit costs for complete schemes are also compared with those of competing fossil-fuelled

heating systems.

Economic Analysis of Potential Uses of Geothermal Energy in Agriculture ,1978 The economic feasibility and water quality considerations of the cultural practice of soil warming was evaluated using existing technical, agronomic, and economic data. It was hypothesized that it is technically and economically feasible to use geothermal energy in the cultural practice of soil warming for specific crops. The analysis attempted to reject the hypothesis. Since the hypothesis could not be rejected, the results are presented as a profit equation suitable for inclusion in the GEOCOST computer program. This determination of economic feasibility utilized heterogeneous crop yield data by comparing the elasticity of response with a normalized product-factor price ratio. Soil warming was determined to be feasible when the elasticity of production was equal to or greater than the normalized product-factor price ratio. A farm enterprise was determined profitable if net returns were positive. An empirical model in which the energy dissipation rate is a function of the difference between heat source temperature and mean monthly air temperature was transformed to utilize data describing the total heat applied during the growing season. Heat input was then measured as the total number of calories per square centimeter applied during the growing season.

Potential of Low-Medium Enthalpy Geothermal Energy Elisabet Palomo, Antonio Colmenar-Santos, Enrique Rosales-Asensio, 2022-02-11 This book highlights the importance of geothermal energy by studying its potential either alone or in combination with solar energy, focusing on its industrial application. Its starting point is to identify in a thorough and precise manner the barriers that hinder the implementation of geothermal energy in Spain and the European Union and the measures to be taken to achieve its diffusion and regular use. Next, the book looks at how geothermal energy could contribute to this sector and to the desalination industry in particular, analysing a specific case in the south of Spain and extrapolating its results to a set of existing desalination plants in the Spanish Mediterranean with really interesting results in terms of economic amortisation and CO2 emissions avoided to the atmosphere. Beyond the desalination industry, this work demonstrates that almost 85% of the industrial processes of all industry in Spain can be carried out with very low, low and medium temperature geothermal resources and even applies its results to a set of existing solar plants, comparing in economic terms the results already obtained with those that would have been obtained if geothermal energy had been applied.

Economic Analysis of Geothermal Energy Costs ,1975 A description is given of the computer program, GEOCOST, and its application to some analyses of the economics of geothermal energy. GEOCOST combines both technical and economic factors into one systematic cost accounting framework. The program, which simulates production of electricity from most types of geothermal resources, is composed of two parts: a reservoir model which simulates the costs associated with the exploration, development, and operation of a geothermal reservoir; and a power-plant model which simulates the costs

associated with the design, construction, and operation of the power plant. The costs from the reservoir model become the energy supply costs to the power plant. The combined reservoir and power plant models represent the complete energy production system. (LBS).
