This book gives a step-by-step approach to CE marking of electrical and electronic equipment including risk assessment. It covers, in detail, five important directives viz. low voltage directive (LVD), electromagnetic compatibility (EMC) directive, medical devices directive (MDD), radio equipment directive (RED) and the RoHS directive. It provides insights into product design and test methodologies especially EMC and product SAFETY so that the product meets the technical requirements of the applicable standards. It also seeks to clarify the many doubts and misconceptions about CE marking. The book begins with a chapter that introduces the reader to the nuances of the CE marking process, the conformity assessment modules and to compile supporting documents that illustrate the process. This is followed by the chapter on product safety which describes the principles of safety as found in the international IEC and European harmonized safety standards. It provides ways and means to improve product design so as to ensure reasonable compliance when a product is subject to safety evaluation by a test laboratory. Then, there are two chapters dedicated to EMC. One explains the EMC fundamentals, standards and the test methodology while the other deals with EMC design. The design chapter contains ways and means to incorporate EMC measures like line filters, shielding, grounding and cable routing at the design stage so that the product can comply with the EMC tests with a minimum of iterations. The design means discussed are very practical in nature and are given in such a way that the design engineer can immediately incorporate them without worrying too much about theory. All the directives now-a-days require a detailed risk assessment to be carried out in addition to testing as per standards. Thereafter the risk assessment needs to be documented so as to demonstrate how the risks have been reduced/eliminated. The book deals with the risk assessment in detail for all the directives under consideration. And last but not the least, the CE marking procedure is not complete unless the entire process is documented through the so-called technical file or technical documentation. The last chapter explains the compilation of technical documentation as required by the directives and the European surveillance authorities.

use with medical grade gases that have a purity level of 99.5%. The purity levels required in laboratories, however, start at 99.9% for general industrial use through to 99.9995% (Ultra High Purity (UHP)) and higher. Regular medical gas standards are also unsuitable for use with the oxidizing, flammable, and, in some instances, toxic gases that are regularly encountered in laboratories. As need for gas purity increases, the methodology used to design a piping system must vary to meet those parameters, and this reference provides the necessary information and resources. There are no comprehensive single sources of technical references currently available in this market, states the author, and the generally supplied specifications provided to the construction industry are usually generic and not specifically targeted for the gases in use. The results provide extremely poor quality designs and, in some instances, unusable systems. With over 40 years of specialization in the industry from project management to systems design, testing, and commissioning of projects with values in excess of \$15 million, the author comprehensively fills that gap with this rich resource. Key features

- provides information on types of laboratories that use laboratory gases and the equipment needed
- explains the various methods of construction and the materials used to ensure that the purity of the gases remains as supplied from the manufacturers
- incorporates the design methodology used to meet the various requirements of the laboratory and the information required to ensure that the correct engineering is provided
- presents information on the purity levels of the gases and the data on the equipment used for pipelines and compatibility issues
- presents an example of a simple laboratory gas specification that provides guidelines on the information necessary to provide a set of design documents
