Principles and Practice of Big Data: Preparing, Sharing, and Analyzing Complex Information, Second Edition updates and expands on the first edition, bringing a set of techniques and

algorithms that are tailored to Big Data projects. The book stresses the point that most data analyses conducted on large, complex data sets can be achieved without the use of specialized suites of software (e.g., Hadoop), and without expensive hardware (e.g., supercomputers). The core of every algorithm described in the book can be implemented in a few lines of code using just about any popular programming language (Python snippets are provided). Through the use of new multiple examples, this edition demonstrates that if we understand our data, and if we know how to ask the right questions, we can learn a great deal from large and complex data collections. The book will assist students and professionals from all scientific backgrounds who are interested in stepping outside the traditional boundaries of their chosen academic disciplines. Presents new methodologies that are widely applicable to just about any project involving large and complex datasets Offers readers informative new case studies across a range scientific and engineering disciplines Provides insights into semantics, identification, de-identification, vulnerabilities and regulatory/legal issues Utilizes a combination of pseudocode and very short snippets of Python code to show readers how they may develop their own projects without downloading or learning new software

This new edition of the successful calendars book is being published at the turn of the millennium and expands the treatment of the previous edition to new calendars and variants. As interest grows in the impact of seemingly arbitrary calendrical systems upon our daily lives, this book frames the world in a completely algorithmic form. The book gives a description of twenty-five calendars and how they relate to one another: the Gregorian (current civil), ISO (International Organization for Standardization), Egyptian (and nearly identical Armenian), Julian (old civil), Coptic, Ethiopic, Islamic (Moslem), modern Persian (both astronomical and arithmetic forms), Baha'i (both present and future forms), Hebrew (Jewish), Mayan (long count, haab, and tzolkin), Balinese Pawukon, French Revolutionary (both astronomical and arithmetic forms), Chinese (and nearly identical Japanese), old Hindu (solar and lunisolar), and modern Hindu (solar and lunisolar). Easy conversion among these calendars is a by-product of the approach, as is the determination of secular and religious holidays. Calendrical Calculations makes accurate calendrical algorithms readily available for computer use with LISP, Mathematica, and Java code for all the algorithms included on the CD, and updates are available on the Web. This book will be a valuable resource for working programmers as well as a fount of useful algorithmic tools for computer scientists. In addition, the lay reader will find the historical setting and general calendar descriptions of great interest.

The Oxford Companion to the Year explores the fascinating history of calendars in general and our own in particular. The calendar used in the West today is just one of a multitude of systems for parcelling up time and naming its divisions. Each of its days has over the centuries acquired its own peculiar significance: the feast day of a saint, the celebration of a historical event, the subject of prose or poetry, the commemoration of a significant historical figure. And for these feasts and seasons there has grown up a rich body of traditions, beliefs, and superstitions, many of them only half-remembered today. Now, for the first time, this body of knowledge is combined with a wide-ranging survey of calendars in an authoritative, absorbing Companion. The first section of The Oxford Companion to the Year is a day-by-day survey of the calendar year, revealing the history, literature, legend, and lore associated with each season, month, and date. The second part is a broader study of time-reckoning: historical and modern calendars, religious and civil, are explained, with handy tables for the conversion of dates between various systems, and special attention is given to the calculation of Easter. There is a helpful index to facilitate speedy reference. This is a unique reference source, an indispensable aid for all historians and antiquarians, and a rich mine of information, inspiration, and delight for browsers.
