This book brings together, and integrates the three principal areas of environmental engineering water, air, and solid waste management. It introduces a unique approach by emphasizing the relationship between the principles observed in natural purification processes and those employed in engineered systems. First, the physical, chemical, mathematical, and biological principles that define, measure and quantify environmental quality are described. Next, the processes by which nature assimilates waste material are discussed and the natural purification processes that form the basis of engineered systems are detailed. Finally, the engineering principles and practices involved in the design and operation of environmental engineering works are covered at length. Written in a lucid style and offering abundant illustrations and problems, the book provides a treatment of environmental engineering that can be understood by a wide range of readers.

This book offers the most in-depth, step-by-step coverage available of contemporary water treatment plant planning, design and operations. Readers can walk step by step through water treatment plant planning and design, including predesign reports, problem definition, site selection and more.

The book in its present form introduces detailed descriptions and illustrative solved problems in the fields of Water Supply, Sanitary and Environmental Engineering. The entire subject matter has been split up in three parts: Part I Water Supply Engineering Part II Sanitary Engineering Part III Environmental Engineering. The first part deals with Water Supply Engineering which is related to demand of water for various purposes in human life, sources of water supply, quantity and quality of water, treatment and distribution of water, etc. The second part deals with Sanitary Engineering which is related to quality and quantity of sewage, construction and design of sewers, methods of treatment of sewage, etc. The third part discusses various aspects of Environmental Engineering including air pollution, noise pollution, etc. A typical design of a domestic sewage treatment plant is given in the Appendix as an additional attraction. The book now contains: * 253 * 140 * 60 * 610 Self-explanatory and neat diagrams Illustrative problems Useful tables Questions at the end of chapters. It is hoped that the book in its present form will be extremely useful to the Engineering students preparing for the Degree Examinations in Civil Engineering of all the Indian Universities, Diploma Examinations conducted by various Boards of Technical Education, Certificate Courses as well as for A.M.I.E., U.P.S.C., other similar Competitive and Professional Examinations.

Intended as a companion volume to the author's Limit State Design of Reinforced Concrete (published by Prentice-Hall of India), the Second Edition of this comprehensive and systematically organized text builds on the strength of the first edition, continuing to provide a clear and masterly exposition of the fundamentals of the theory of concrete design. The text meets the twin objective of catering to the needs of the postgraduate students of Civil Engineering and the needs of the practising civil engineers as it focuses also on the practices followed by the industry. This text, along with Limit State Design, covers the entire design practice of revised Code IS456 (2000). In addition, it analyzes the procedures specified in many other BIS codes such as those on winds, earthquakes, and ductile detailing. What's New to This Edition Chapter 18 on Earthquake Forces and Structural Response of framed buildings has been completely revised and updated so as to conform to the latest I.S. Codes 1893 (2002) entitled Criteria for Earthquake Resistant Design of Structures (Part I - Fifth Revision). Chapters 19 and 21 which too deal with earthquake design have been revised. A Summary of elementary design of reinforced concrete members is added as Appendix. Valuable tables and charts are presented to help students and practising designers to arrive at a speedy estimate of the steel requirements in slabs, beams, columns and footings of ordinary buildings.

A junior/senior-level introductory text aimed at civil and environmental engineers taking a basic introduction to Solid Waste Management. The text includes the latest 1990-1991 laws and regulations.

Berdasarkan KepPres No. 26 Tahun 2011 Tentang Penetapan Cekungan Air tanah, ruang darat Indonesia di bawah muka tanah dibagi menjadi daerah cekungan air tanah (CAT) dan Bukan (Non) CAT atau CAT tidak potensial. Perinciannya adalah ruang darat seluas 1,922,600 km² (100 %) terdiri atas CAT seluas 907,615 km² (atau 47,2 % luas daratan) dan Non-CAT seluas 1,014,985 km² (atau 52,8 % luas daratan). Mengacu pada definisi tata ruang dalam UU No. 26 Tahun 2007 Tentang Penataan Ruang, tata ruang air tanah dapat didefinisikan sebagai wujud struktur ruang air tanah dan pola ruang air tanah. Struktur ruang air tanah adalah susunan pusat-pusat sumber daya air tanah dan sistem infrastruktur air tanah berupa akuifer tertekan (confined aquifer) dan akuifer bebas (unconfined aquifer) dalam cekungan air tanah (groundwater basin). Air tanah dalam hal ini terjemahan dari groundwater namun juga air tanah yang diterjemahkan dari soil water. Di atas groundwater ada daerah vadoze zone yang berisi soil water. Air dalam perspektif siklus hidrologi secara global mengikuti, lewat, berada dan mengalir melalui ruang udara, ruang darat (baik daerah CAT maupun daerah Non-CAT) dan ruang laut. Air terdiri atas air permukaan, air tanah, air hujan dan air laut yang berada di darat. Dari sisi air tanah maka ada beberapa substansi penting dalam ruang darat, yaitu: - Karakter CAT dan Non-CAT berbeda baik di muka bumi maupun di bawah muka bumi. - Di daerah CAT air tanah terdiri atas groundwater dan soil water. Di daerah Non-CAT hanya ada soil water. - Di muka bumi CAT dan Non-CAT mempengaruhi fluvial system (DAS dan sistem jaringan sungainya). - Ada beberapa daerah CAT di Indonesia yang bersifat aluvial, produk dari sedimen muda dan terletak di cekungan sedimen muda (young sedimentary basin) terbentuk pada jaman kuartar/holosen.

Di daerah ini fluvial system bersifat saluran/sungai beregim (channel in regime) sedangkan fluvial system daerah Non-CAT termasuk daerah saluran/sungai non regim (non-regime channel). o Sungai beregim (daerah CAT) akan selalu berubah untuk mencapai keseimbangan antara agradasi (penambahan sedimen) dan degradasi (gerusan). Muatan sedimen utamanya pasir, lanau dan lempung umumnya ada di sungai ini. o Sungai non regim (daerah Non-CAT) dikontrol oleh: lapisan batuan dasar dan aluvial tua. o Dengan kata lain keberadaan air tanah dalam CAT dan Non-CAT berpengaruh terhadap air permukaan sekaligus dengan sumber daya air. - Ada juga daerah CAT yang bukan aluvial misalnya CAT pada batuan kapur, di mana air mengalir melalui celahan atau rekahan batuan tersebut. - Di daerah Non-CAT potensi longsor tinggi. Contoh yang pernah terjadi yaitu bencana banjir bandang Leuser di Sumatra, bencana Wasior di Papua, longsor di Banjarnegara Jawa Tengah, gerakan tanah pada pembangunan Jalan Tol Semarang Solo di Ungaran dan Penggaron dan amblesnya beberapa bangunan di Proyek Hambalang. - Di daerah CAT dengan kedalaman dangkal banyak terjadi perubahan sungai dan juga berpotensi longsor. Contoh perubahan sungai adalah S. Palu di Kota Palu dan contoh longsor yang pernah terjadi adalah bencana longsor di Desa Pulau Aro Kecamatan Sekernan Kabupaten Muaro Jambi yang dilalui S. Batanghari yang terjadi di Bulan Agustus lalu. - Indonesia merupakan negara kepulauan (archipelago islands) yang terluas di dunia dengan jumlah pulau 17508. Lima pulau besar dengan luas > 100000 km² adalah Kalimantan, Sumatra, Papua, Sulawesi, Jawa; ada 26 pulau mempunyai luas 2000 km²; sisanya 17477 (99,8% dari seluruh pulau) adalah pulau-pulau kecil dengan luas This work provides a thorough treatment of environmental engineering. The text makes use of many practical, hands-on examples throughout to demonstrate the applied nature of the field. This text combines comprehensive and authoritative coverage with current applications.

Design of water distribution networks is traditionally based on trial-and-approach in which the designer assumes, based on experience and judgment, sizes of different elements and successively modifies them until a network with satisfactory hydraulic performance is obtained. This text covers: - Essential hydraulic, economic optimization principles. - Theory is developed gradually for optimal design of simple, single-source branched networks subjected to single loading to complex, multiple-source looped networks subjected to multiple loading. - Strengthening and expansion of existing networks and also reliability-based design. - Several illustrative examples enabling the reader to apply them in practice- approximately 100 line drawings.

This book covers the fundamentals of environmental engineering and applications in water quality, air quality, and hazardous waste management. It begins by describing the fundamental principles that serve as the foundation of the entire field of environmental engineering. Readers are then systematically reintroduced to these fundamentals in a manner that is tailored to the needs of environmental engineers, and that is not too closely tied to any specific application.
