Current rates of autism diagnoses have been cause for concern and research as well as rumor and misinformation. Important questions surround the condition: how early can an accurate diagnosis be made? At what age should intervention start? How can parents recognize warning signs? And what causes autism in the first place? There are no easy answers, but the Handbook of Early Intervention for Autism Spectrum Disorders gives researchers, practitioners, and academics the science and guidance to better understand and intervene. Background chapters survey the history of professional understanding of the disorders and the ongoing debate over autism as a single entity or a continuum. Chapters on best methods in screening, assessment, and diagnosis reflect the transition between the DSM-V and older diagnostic criteria. And at the heart of the book, the intervention section ranges from evidence-based strategies for developing core skills to ethical concerns, cultural considerations, and controversial treatments. Included in the Handbook's broad-based coverage: Designing curriculum programs for children with autism spectrum disorders (ASD). Mainstream education for children with ASD. Teaching independent living skills to children with ASD. Social skills and play. Behavioral and mental health disorders in

children with ASD. Training and supporting caregivers in evidence-based practices. Teaching cognitive skills to children with ASD. The Handbook of Early Intervention for Autism Spectrum Disorders is a comprehensive reference for researchers, professors, and graduate students as well as clinicians and other scientist-practitioners in clinical child and school psychology, child and adolescent psychiatry, social work, rehabilitation, special education, and pediatric medicine.

The Gilliam Autism Rating Scale - Second Edition (GARS-2; Gilliam, 2006) is a widely used screening tool that assists in the identification and diagnosis of autism spectrum disorders (ASDs). Although this assessment measure is commonly used during autism assessments, there has been little research on its psychometric properties. The purpose of this study was to examine the factor structure, internal consistency and screening sensitivity of GARS-2 ratings completed by special education teaching staff for a sample of students (N = 216) with autism spectrum disorders. The exploratory factor analysis supported the retention of three factors labeled Stereotyped and Repetitive Behaviors, Social Avoidance and Withdrawal, and Atypical Language and Communication. These three factors were very similar to those found in prior research by Lecavalier (2005) on the original GARS and Volker et al. (under review) using the GARS-2 with a more mixed developmental disabilities sample. In the present study, internal consistency estimates met or exceeded standards for screening and were generally higher than those in previous studies. Using an Autism Index cut score of 85 yielded a screening sensitivity of . 5879, while a cut score of 90 yielded a sensitivity of . 4537. These sensitivity results were generally similar to those of prior studies involving the GARS or GARS-2. It is noteworthy that

Acces PDF Gilliam Autism Rating Scale Second Edition Gars 2

the three-factor solution retained in the present study matches very closely with those from two prior studies with different samples (i.e. , Lecavalier, 2005; Volker et al. [under review])--suggesting the presence of a robust three-factor structure. However, this factor structure was different from the four-factor structure found by Pandolfi, Magyar and Dill (2010) using the GARS-2 standardization sample. Although this study provides some psychometric support for the use of the GARS-2 as a screening tool, the sensitivity estimates for the Autism Index suggest that the instrument results in a high percentage of false negative results for ASD. This significantly limits the GARS-2's utility and, along with the factor analytic results, suggests the need to substantially revise the instrument. Implications for instrument revision and future research are provided.

The state of North Carolina has had a longstanding concern and com mitment to the understanding and treatment of autistic, communications handicapped children and their families. This commitment found expres sion in the only comprehensive statewide program for families confronted with this disability, Division for the Treatment and Education of Autistic and related Communication handicapped CHildren (Division TEACCH). Our program staff has been privileged to respond to this commitment by developing and providing the needed services, and to engage in research informed by our clinical experience. decade of collaboration among professionals, parents, and their government representatives. The TEACCH staff has resolved to mark the effectiveness of this collaboration by holding a series of annual conferences focused on the several major issues confronting these children and their families. The conferences are held in order to bring together the best research knowledge available to us from throughout the country, and to encourage participation by the different professional disciplines and concerned parents. In addition these annual meetings form the basis for a series of books based on the conference theme. These books are, however, not merely the published proceedings of the presented papers: some chapters are expanded from conference presentations and many others were solicited from experts in the related areas of research and their service application. Comprehensive and user friendly, this ideal professional reference and graduate text provides a developmentally informed framework for assessing 3- to 6-year-olds in accordance with current best practices and IDEA 2004 guidelines. The authors are leading clinician-researchers who take the reader step by step through selecting appropriate measures, integrating data from a variety of sources, and using the results to plan and evaluate effective interventions and learning experiences. Coverage encompasses screening and assessment of cognitive, linguistic, emotional, and behavioral difficulties, including mental retardation and autism. Case studies illustrate key facets of assessing diverse children and families; appendices offer concise reviews of over 100 instruments.

Children are being diagnosed with autism spectrum disorders at a staggering rate—as many as one in 110, according to some studies. To this sobering statistic add the familiar figures of the toddler disengaged from his peers, the middle schooler shunned in the lunchroom, and the adult struggling
