This timely text examines normative and pathological brain/behavior connections across the male lifespan, and how these findings can best inform research, intervention, and prevention. It spotlights possible etiologies for male-dominated pathology, including academic deficits and disorders relating to violence, as well

as identifying men's psychological resilience and vulnerabilities throughout life. Clinical and social issues are intricately linked here, particularly in areas such as substance abuse, emotion processing, and sequelae of brain trauma. In these ways, the text moves on from the simplistic view of males as the standard in psychological studies while respecting complicated questions about biology and environment that have yet to be resolved. Since the inception of psychology, much research has focused specifically on men but few studies have offered distinctive interventions developed to help this unique male population. This volume fills the chasm left from many seminal studies. Among the featured topics: · Imaging and development: relevant findings in males. · Understanding the neuropsychology of autism spectrum disorders in men. · Understanding disorders of defiance, aggression, and violence in males. · Serving men with traumatic brain injuries. · Men at risk: special education and incarceration. · The neuropsychological basis of emotion and social cognition in men. The *Neuropsychology of Men* offers neuropsychologists, clinical psychologists, and rehabilitation specialists an evidence-based framework for understanding male-specific cognitive and behavioral trends in the normative population, and for identifying and addressing challenges in boys and men outside the norm. A definitive and evidence-based guide for psychologists, teachers, coaches, HR personnel and all professionals who must understand and work with dyslexic adults. The only book to look at dyslexia within the context of life span developmental psychology, including the factors that contribute to success - now fully revised and updated Combines an accessible style with a strong focus on evidence-based practice and a sound theoretical model on which to base assessment, counselling, teaching and training Provides a clear guide to the kinds of assessment that can be conducted and the ways in which dyslexic adults can be supported in selection, training, education and employment Includes coverage of overlapping syndromes such as dyspraxia and dyscalculia, and up-to-date check lists for syndromes that can be used as part of the assessment process

ASSESSING AND DIFFERENTIATING READING & WRITING DISORDERS: A MULTIDIMENSIONAL MODEL provides a framework for differentiating among various types of reading and writing disorders in order to assist the practitioner in establishing a differential diagnosis. In the recent literature, the most influential case study books in neuropsychology are in the adult realm. Pediatric neuropsychology is a rapidly developing field with increasingly greater influence in the assessment, diagnosis, early identification, and treatment of childhood illnesses. This book will provide the first centralized, comprehensive resource for case studies in pediatric neuropsychology. Not only will this supply a valuable compilation for the growing numbers of professionals in this field, but will also serve as an innovative and appealing resource for therapists, teachers, and others interested in child development. This book will be structured in such a way that readers can easily access individual cases of interest, as well as related areas of dysfunction. Section breakdowns will be provided in order to highlight the combined focus of case presentations in acquired neuropsychological dysfunction as well as developmental disorders. Each section will begin with an introductory chapter, highlighting the salient feature of the concept and providing brief, up to date reviews of the current research and theories. Within each global section, individual case studies will serve as stand-alone chapters. Contributing authors will be provided extensive guidance and coaching with regards to the standard format and information to be included in each chapter. The first section of this book will present cases involving neurological disorders. The intention of this section is to provide not only "classic" examples of neurological dysfunction in children, but also to provide interesting cases of unique or remarkable presentations. The second section will present an accumulation of cases representing both common and progressive conceptualizations of developmental disabilities. Section three has been designed to highlight cases which often present complex issues to neuropsychologists. The case examples in this section will highlight the use of alternative treatments, pathologies that are often a source of inquiry, and situations that lack the more rigorous scientific data often utilized in other diagnostic procedures. Additionally, this section may include chapters on common differential diagnosis dilemmas in clinical practice. Often multifaceted and even contradictory evidence can arise during evaluations, resulting in complex or problematic situations for the clinician.

Such examples are difficult, by their nature, to forecast, but rather would be added during the book's development, as they occur.

Representing the state of the art in multimedia applications and their promise for enhancing early literacy development, this volume broadens the field of reading research by looking beyond print-only experiences to young readers' encounters with multimedia stories on the Internet and DVD. Multimedia storybooks include, in addition to static pictures and written text, features such as oral text, animations, sounds, zooms, and scaffolds designed to help convey meaning. These features are changing how young children read text, and also provide technology-based scaffolds for helping struggling readers. Multimedia and Literacy Development reports experimental research and practices with multimedia stories indicating that new dimensions of media contribute to young children's ability to understand stories and to read texts independently. This is the first synthesis of evidence-based research in this field. Four key themes are highlighted: Understanding the multimedia environment for learning Designing multimedia applications for learning New approaches to storybook reading Multimedia applications in classroom instruction. Written in jargon-free language for an international audience of students in university courses on literacy and information technology, researchers, policymakers, program developers, and media specialists, this volume is essential reading for all professionals interested in early literacy and early interventions.
