

Industrial Engineering In Apparel Production Ssenseore

In the textile industry, there is a pressing need for people who can facilitate the translation of creative solutions from designers into manufacturing language and data. The design technologist has to understand the elements and principles employed by designers and how these change for various textile media. One must also have a good understanding of the processes, materials and products for which the textile designer is required to produce creative solutions. This book will be for designers wishing to improve their technological knowledge, technologists wishing to understand the design process, and anyone else who seeks to work at this design-technology interface. Key Features: • Provides a comprehensive information about textile production, apparel production and the design aspects of both textile and apparel production. • Fills the traditional gap between design and manufacture changing with advanced technologies. • Includes brief summary of spinning, weaving, chemical processing and garmenting. • Facilitates translation of creative solutions from designers into manufacturing language and data. • Covers set of workshop activities.

Industrial engineering practitioners don't have to be computational experts. They just have to know where to get the computational resources that they need. This book provides access to computational resources needed by industrial engineers. It consists of several sections that each focus on a particular specialization area of industrial enginee

Productivity improvement means doing the same thing in a better and smarter way and continuing to work on improving the techniques for an individual or a team on the shopfloor. And this continuous improvement is the only way to achieve high profitability. Garment manufacturing involves number of operations carried out by different operators and all the activities starting from cutting, sewing till finishing are different from each other in terms of the way they are performed and the technology being used for them. So, it is always advisable to look at the working of four aspects and that are material, machine, men and method. However there are ways to build higher productive efficiencies which result in reduction in cost and bring in higher profit margin.. The book discusses different case studies from the shopfloor showing productivity improvements.

This book is part of a five-volume set that explores sustainability in textile industry practices globally. Case studies are provided that cover the theoretical and practical implications of sustainable textile issues, including environmental footprints of textile manufacturing, consumer behavior, eco-design in clothing and apparels, supply chain sustainability, the chemistry of textile manufacturing, waste management and textile economics. The set will be of interest to researchers, engineers, industrialists, R&D managers and students working in textile chemistry, economics, materials science, and sustainable consumption and production. This volume focuses on sustainability aspects of consumerism and fashion, emphasizing the environmental issues that stem from textile care and disposal, and how many of these practices detrimentally impact the environment. Also addressed is the role of consumer knowledge and behavior associated with the clothing industry that may exacerbate these issues, and what can be done to better inform consumers about more sustainable options available to them. The case studies presented cover environmental and social sustainability in the clothing industry, and sustainable development in luxury fashion networks.

This book will serve as one best reference to the Apparel Engineers in the garment industry, as well as learners and professions. Apparel Engineering is a term to explain the industrial engineering activities to be used in Apparel Production process, this will include methods to reduce Man, Machine and Material wastage in the Apparel Production process, it includes selection of right tools and machines, training to the operators for quality and fast production, material management, ergonomics to use in apparel industry, methods development and advanced production planning and development of method study and Workstudy applications in production process, Line balancing to product handling. The whole booklet is capsuled to easy knowledge by reducing long theories. Maximum real time data from industry are used to generate and explain the calculations so that the methods can easily be adapted to industries by their industrial Engineers. In this book, author has tried to explain the ideas of, Wastage, Facility Layout and Material Planning, Material Flow system, Plant Layouts, Factory layout, Economics of Material Handling, Production Systems, Capacity planning, Marker Planning & cutting, Processing of fabric faults, Marker utilisation, Cut order planning, Workstudy Procedures, Micromotion studies, Production studies, Work Measurement Techniques, Performance rating, Allowances, Industrial Ergonomics, Principles of Motion Economy, Production Planning Process, Line Planning, Capacity Planning, Line Balancing, WIP, Scheduling Orders, Manufacturing Lead Time, Load Levelling, Scheduling Bottlenecks, Operation Scheduling, Production Reporting, Job evaluation & Compensation, Designing wage structure, Incentive plan etc Second edition has many more ad-ones and data tables for professional reference.

While there is pressure (from buyers), inclination (within self to do better) and a heightened aspiration among apparel manufacturers to use Industrial Engineering (IE) like other more industrialized sectors, there is no specific book as such dealing with IE in relation to apparel manufacturing. The existing books that are already written on IE possess academic rigour and generic functions applicable across industries, thus making it difficult for the practitioners to refer and clear discrete doubts related to apparel manufacturing. Undoubtedly, work study is the centrepiece of Industrial Engineering; however apart from work study, industrial engineers in apparel industry are also supposed to perform various other functions like preparing operation breakdown and operation flow chart, selecting machine type and attachment and workaids, planning machine layout for maximizing unidirectional material movement, optimising inventory and storage space and maintaining workplace health and safety. These are some of the areas that often lack significant attention. This practitioner's handbook is an amalgamation of theory and practices, including steps of implementation and common mistakes. A balanced approach is taken to make it equally meaningful and useful for the academics as well as the industry. A unique section titled "industry practices" is incorporated at the end of each chapter which shares the typical practices, constraints and benefits accrued by the industry, which will give meaningful insight to the readers and help them relate theory with actual practice.

The 'machines' as we see them today use certain level of technology which is contemporary to today's standards. In garment manufacturing, activities have been mechanized over a period of time and mechatronics and electronics are added to enable better productivity, repeatability of output and consistency of quality. In the last one-and-a-half decade, the integration of computer and information technology made the machines capable of generating, storing and transmitting data automatically with added ease of diagnostics and quick repair. The future will likely see these machines support sustainable practices while becoming energyefficient and caring for the environment. The book traces the evolution of technology for different garment manufacturing machinery and equipment and how the gradual improvement of features has supported the users.

Textile products are produced, distributed, sold and used worldwide. A quantitative assessment of sustainability in the textile manufacturing chain is therefore extremely important. The Handbook of sustainable textile production is a compilation of technical,

economical, and environmental data from the various processes in this chain. This authoritative reference work provides a detailed study of the sustainable development of textiles. The book opens with an introduction to the topic. Chapters define the principles of sustainability and its use in legislation and industry before going on to investigate the impact of textiles throughout the supply chain, starting with the raw fibre through to fabric production, consumption and disposal. Textile process technology and methods for specifying quality and functions in textile products in order to reduce textile waste and improve sustainability are also examined. A series of Life Cycle Assessments (LCAs) carried out in the European textile industry are investigated. These studies comprise a range of processes from cotton growing, spinning and weaving to the recycling of textiles. The book concludes with a discussion on sustainable textiles from a product development and marketing perspective. With an internationally recognised expert author, the Handbook of sustainable textile production is a valuable reference tool for academics and students as well as for companies across the textile supply chain concerned with developing a sustainable environment, from fibre manufactures and designers to regulatory bodies. A detailed, quantitative assessment of the sustainable development of textiles Provides a useful compilation of technical, economical, and environmental data from various processes in the textile manufacturing chain Chapters define the principles of sustainability and its use in legislation and industry, textile process technology, the impact of textiles throughout the supply chain, raw fibre through to fabric production, consumption and disposal

The increasing environmental and health concerns owing to the use of large quantities of water and hazardous chemicals in conventional textile finishing processes has led to the design and development of new dyeing strategies and technologies. Sustainable Practices in the Textile Industry comprises 13 chapters from various research areas dealing with the application of different sustainable technologies for enhancing the dyeing and comfort properties of textile materials with substantial reduction in wastewater problems. Chapters focus on the sophisticated methods for improving dye extraction and dyeing properties which will minimize the use of bioresource products. This book also brings out the innovative ways of wet chemical processing to alleviate the environmental impacts arising from this sector. This book also discusses innovations in eco-friendly methods for textile wet processes and applications of enzymes in textiles in addition to the advancements in the use of nanotechnology for wastewater remediation.

A hot-button societal issue, sustainability has become a frequently heard term in every industrial segment. Sustainability in apparel production is a vast topic and it has many facets. Handbook of Sustainable Apparel Production covers all aspects of sustainable apparel production including the raw materials employed, sustainable manufacturing processes, and environmental as well as social assessments of apparel production. The book highlights the environmental and social impacts of apparel and its assessment. It explores the complexities involved in implementing sustainable measures in the massive supply chain of apparel production. The discussion then turns to sustainability and consumption behavior of the apparel industry and the assessment of sustainability aspects and parameters. The text details technologies that can pave the way toward sustainability in production and closes with coverage of design aspects, particularly sustainable design/eco design and new approaches to fashion sustainability. A vast and complex topic, sustainability in apparel production has many faces and facets. With contributions from an international panel of experts, this book unites all the elements, including very minute details, and supports them with detailed and interesting case studies. It gives you a framework for moving towards sustainability.

The garment manufacturing industry faces many global challenges due to various factors including competition, increased production costs, less productivity/efficiency and labor attribution. So, there is a need to focus and concentrate on identifying the real issues, taking corrective actions suited to the specific industrial centre of the unit, empowering the technical and managerial staff by enhancing their knowledge and ability, analysing orders efficiently and deciding whether actions are viable for the company. Industrial engineering in apparel production reviews the techniques for internal correction and openness for a knowledge/technology approach that needs to be built into the mind of the faculties to be upgraded as system run, rather than people run. The author emphasizes that the industrial engineering concept needs to be imparted to the facilities to increase productivity. With its highly distinguished author, Industrial engineering in apparel production is a valuable reference for students, researchers, industrialists, academics and professionals in the clothing and textile industry.

This book is written for you if you want to learn the industrial engineering basics, about the necessary tools for engineers and activities done by industrial engineers. This book is for you if you want to work as an industrial engineer in a garment factory. By learning industrial engineers subject, you can bring changes and bring improvement in the factory where you are working and where you will be working. An engineering degree is not necessary to improve a factory's productivity and reducing the manufacturing cost. What is required is the right attitude. If you allow yourself to learn industrial engineering tools, you can learn most of them in one month. Then you can practice these IE tools and IE activities in the next 3 months. After that, you are ready for serving the apparel manufacturing industry. You can make things better in a garment factory. You need to find ways of doing things in a better way - which in turn can bring a huge improvement. If you can improve line efficiency by 1% each week, monthly efficiency improvement will be 4%. In a factory, to bring measurable improvement you need to fight against the odds, resistance from the line supervisor, and non-acceptance of new things and new concepts. To fight against these odds, you need to be strong within yourself through being more knowledgeable, logical, analytical, and proactive. This book will enrich your knowledge. The how-to guide part will increase your confidence in finding solutions and answers to the odd questions at the workplace.

High-Performance Apparel: Materials, Development, and Applications covers the materials and techniques used in creating high-performance apparel, the technical aspects of developing high-performance garments, and an array of applications for high-performance clothing and wearable technology. Part One covers fabric construction for high-performance garments, from fiber types and spinning methods, to weaving, knitting, finishing, and joining techniques. Development of high-performance apparel is covered in Part Two, with particular emphasis on design and product development for function and wearer comfort. Part Three covers a range of applications and wearable technology that make use of high-performance apparel, including chapters on sportswear, protective clothing, and medical, military, and intelligent textiles. The book provides an excellent resource for all those engaged in garment development and production, and for academics engaged in research into apparel technology and textile science. Offers a range of perspectives on high-performance apparel from an international team of authors with diverse expertise Provides systematic and comprehensive coverage of the topic from fabric construction, through apparel design and development, to the range of current and potential applications Presents an excellent resource for all those engaged in garment development and production, and for academics engaged in research

Nonwovens: Process, Structure, Properties and Applications outlines the concept and principle of entire nonwoven manufacturing process starting from raw material selection, web formation techniques, web bonding methods and finishing. Further, characterization and testing of non-woven fabrics, application of non-woven fabrics in different areas such as apparel, agrotech, geotech, medical and hygiene, automotive textiles, filtration products, home textiles, roofing and construction and packaging were also discussed in detail. The advancements in non-woven manufacturing known as composite non-woven, their properties and applications were discussed in detail. The application of natural fibers in non-woven manufacturing with their advantages and limitations were also discussed in brief. This book is primarily a text book intended for textile technology students in universities and colleges, researchers, industrialists and academicians, as well as professionals in the apparel and textile industry.

Fast fashion is an industrial trend that refers to the concept of shortening lead time (production, distribution) and offering new products to the market as fast as possible. Despite an abundance of research results, there is no comprehensive reference source that covers the state-of-

the-art findings on both theoretical modeling and empirical research on fast fashion systems. This edited volume consists of three sections - review and exploratory studies, analytical models, and empirical research – made up of many interesting contributions in the respective domain. The result is a well-balanced handbook which includes both theoretical results (from various perspectives) and empirical findings. This volume will be of interest not only to those involved in the fashion industry, but also to academics and practitioners in the wider fields of business, manufacturing engineering, systems engineering and supply chain management.

The era of mass manufacturing of clothing and other textile products is coming to an end; what is emerging is a post-industrial production system that is able to achieve the goal of mass-customised, low volume production, where the conventional borders between product design, production and user are beginning to merge. To continue developing knowledge on how to design better products and services, we need to design better clothing manufacturing processes grounded in science, technology, and management to help the clothing industry to compete more effectively. Design of clothing manufacturing processes reviews key issues in the design of more rapid, integrated and flexible clothing manufacturing processes. The eight chapters of the book provide a detailed coverage of the design of clothing manufacturing processes using a systematic approach to planning, scheduling and control. The book starts with an overview of standardised clothing classification systems and terminologies for individual clothing types. Chapter 2 explores the development of standardised sizing systems. Chapter 3 reviews the key issues in the development of a garment collection. Chapters 4 to 7 discuss particular aspects of clothing production, ranging from planning and organization to monitoring and control. Finally, chapter 8 provides an overview of common quality requirements for clothing textile materials. Design of clothing manufacturing processes is intended for R&D managers, researchers, technologists and designers throughout the clothing industry, as well as academic researchers in the field of clothing design, engineering and other aspects of clothing production. Considers in detail the design of sizing and classification systems Discusses the planning required in all aspects of clothing production from design and pattern making to manufacture Overviews the management of clothing production and material quality requirements

Here at last is a major revision of a definitive reference on industrial engineering principles and practices. It includes these topics: the industrial function; industrial engineering in practice; methods engineering; work-measurement techniques; work-measurement application and control; incentive programs; manufacturing engineering; human factors, ergonomics, and human relations; economics and controls; facilities and material flow; mathematics and optimization techniques; and special industry applications. With 800 illustrations and an index. Circular Economy in Textiles and Apparel: Processing, Manufacturing, and Design is the first book to provide guidance on this subject, presenting the tools for implementing this paradigm and their impact on textile production methods. Sustainable business strategies are also covered, as are new design methods that can help in the reduction of waste. Drawing on contributions from leading experts in industry and academia, this book covers every aspect of this increasingly important subject and speculates on future developments. Provides case studies on the circular economy in operation in the textiles industry Identifies challenges to implementation and areas where more research is needed Draws on both industrial innovation and academic research to explain an emerging topic with the potential to entirely change the way we make and use clothing

I have been a Lean Management Consultant for the past decade and have been asked interesting questions by my prospects/clients. I'd have to say, the most made statement has been "Lean only works in the Automotive Industry and is not applicable to our industry...". This misconception is what triggered me to write a book on Lean for the various industries that I consult in, i.e. one book for every industry. This book on the application of LEAN in Apparel Manufacturing, is my first foray into authoring a book. This book is an attempt to educate its readers on how to implement the practical aspects of LEAN, on the shopfloor. It begins with the dissemination of the interrelated elements of the Toyota Production System, the objective of TPS and its importance in Production Management. The concepts of LEAN and waste elimination are then explained with an overview of the Seven Types of Manufacturing Wastes. Value Stream Mapping, a frequently used tool to map the waste, has been elaborated in four chapters. These chapters explain concepts like Product Family Matrix, KPI definitions, guiding principles to design a Lean process and the construction of the 'AS IS' and the 'TO BE' Value Stream Maps. Individual chapters are devoted to the elements of TPS like 5S, Visual Management, Skill Management, Process Standardization and Single Minute Exchange of Dies. These chapters explain the concepts and their application in detail, equipping you with the required tools and techniques. The chapter on Balanced Score Card and Hoshin Kanri explains the mechanism of aligning the vision of the factory to the individual objectives. The chapters on A3 Problem Solving and Quality Management initiate the readers to a scientific methodology of problem solving. We follow up with chapters on Kanban Systems and WIP Management in order to get a sense of Pull systems. The chapter on Total Productive Maintenance lays emphasis on measurement of OEE% and the problem-solving cascade. We end this book with chapters on Shopfloor Control, sustaining a Lean culture and providing a Lean Implementation Model for Apparel Manufacturing. I would like to extend my gratitude to Deepak Mohindra, Chairman, Apparel Resources for his continued support and guidance. My wife Manali, my daughters Aishwarya & Arya and my mother Padma, have also been my constant motivators. I would also like to thank my past and current clients for implementing my advice. This book would be incomplete without mentioning Ashish Grover, who was a great support during preliminary Lean pilots on the garmenting shopfloor. This book is my tribute to him. I hope that this book creates more value for you and your organization. Wish you all the best in your LEAN journey!

Apparel Engineering is a term to explain the industrial engineering activities to be used in Apparel Production process, this will include methods to reduce Man, Machine and Material wastage in the Apparel Production process, it includes selection of right tools and machines, training to the operators for quality and fast production, material management, ergonomics to use in apparel industry, methods development and advanced production planning and development of method study and Workstudy applications in production process, Line balancing to product handling. The whole booklet is capsuled to easy knowledge by reducing long theories. Maximum real time data from industry are used to generate and explain the calculations so that the methods can easily be adapted to industries by their industrial Engineers. In this book, author has tried to explain the ideas of, Wastages, Facility Layout and Material Planning, Material Flow system, Plant Layouts, Factory layout, Economics of Material Handling, Production Systems, Capacity planning, Marker Planning & cutting, Processing of fabric faults, Marker utilisation, Cut order planning, Workstudy Procedures, Micromotion studies, Production studies, Work Measurement Techniques, Performance rating, Allowances, Industrial Ergonomics, Principles of Motion Economy, Production Planning Process, Line Planning, Capacity Planning, Line Balancing, WIP, Scheduling Orders, Manufacturing Lead Time, Load Levelling, Scheduling Bottlenecks, Operation Scheduling, Production Reporting, Job evaluation & Compensation, Designing wage structure, Incentive plan etc This book will serve as one best reference to the Apparel Engineers in the garment industry, as well as learners and professions.

The highly illustrated Apparel Production Terms and Processes follows the product life cycle from concept through completion. The new edition takes a global perspective with expanded coverage of sizing standards and fit information to complete the scope of the apparel production process.

The role of quality assurance is to ensure that once a specification has been agreed, every product and every production run meets that standard. The Fundamentals of Quality Assurance in the Textile Industry describes how quality professionals in the apparel industry coordinating with overseas factories can ensure excellence. The author explains what tools are required and how to manage products from style conception to finished production and the methods used to track and evaluate samples and production at each stage of the critical path. This book reinforces the concept that quality assurance must become an integral part of the business and details crucial procedures that

have been adopted internationally.

Industrial Engineering in Apparel Manufacturing Apparel Resources Pvt. Ltd.

Textile manufacturing is an important subject in textile programs and processing industries. The introduction of manmade and synthetic fibers, such as polyester, nylon, acrylic, cellulose, and Kevlar, among others, has greatly expanded the variety of textile products available today. In addition, new fiber development has brought about new machines for producing yarns, fabrics, and garments. Textile Manufacturing Processes is a collection of academic and research work in the field of textile manufacturing. Written by experts, chapters cover topics such as yarn manufacturing, fabric manufacturing, and garment and technical textiles. This book is useful for students, industry workers, and anyone interested in learning the fundamentals of textile manufacturing.

Apparel manufacturing globally remains the same over the last fifty years; only migrated from one country to another in search of cheap labour. Notwithstanding, the changing economics of production and distribution, shifts in consumer demand, the emergence of "fast fashion" and the political agenda of reshoring and sustainable manufacturing are pushing apparel manufacturers to explore radically new ways of creating and capturing value. The fourth industrial revolution more commonly known as Industry 4.0 has already brought a plethora of technologies for adoption in manufacturing. The increased processing power of computing and miniaturization of chip size is making things earlier thought impossible, possible. The reduction in cost of data processing, storing and transferring has made AI and ML affordable for commercial use. The mighty robots changed themselves to safe co-bots to work alongside human workers. A wind of change is visible, and the apparel manufacturing industry is also embracing newer technologies and manufacturing concepts to herald in the new era of future manufacturing. This book details how different technologies are going to shape apparel manufacturing factories of the future.

The never-ending global search for a country with a low labour wage is almost bottoming out. The so-called labor-oriented apparel manufacturing industry is poised to change. Due to fierce global pressure on reducing price and lead time, the textiles and apparel producers will have to banish all waste from their supply chain. Lean manufacturing which removes waste and smoothens the process flow is gaining popularity among textiles and apparel producers and will be a key element for the survival of the industry in the years ahead. An overview of various lean tools with a balanced mix of conceptual knowledge and practical applications in the context of apparel manufacturing Valuable industry information which managers and engineers can follow themselves without the need to hire outside consultants Case studies and examples from apparel manufacturing demonstrating how lean tools are being used successfully by leading organizations; an academician's delight Possible use cases of several lean tools having potential use in the apparel manufacturing scenario

This book discusses the design of textile production within the framework Industry 4.0. Relevant research topics in the textile industry are identified and solutions are conceptualized, developed and implemented. This is followed by an evaluation of the solutions in which, among other things, the profitability is considered. Questions about the transfer of knowledge into the company complete the work. Industry 4.0 in Textile Production provides a rich investigation into and survey of textile production The informative cases studies, clear perspective, and detailed analysis make this book of great use to engineers, researchers and postgraduate students interested in the textile industry.

This book aims to provide a broad conceptual and theoretical perspective of apparel manufacturing process starting from raw material selection to packaging and dispatch of goods. Further, engineering practices followed in an apparel industry for production planning and control, line balancing, implementation of industrial engineering concepts in apparel manufacturing, merchandising activities and garment costing have been included, and they will serve as a foundation for future apparel professionals. The book addresses the technical aspects in each section of garment manufacturing process with considered quality aspects. This book also covers the production planning process and production balancing activities. It addresses the technical aspects in each section of garment manufacturing process and quality aspects to be considered in each process. Garment engineering questions each process/operation of the total work content and can reduce the work content and increase profitability by using innovative methods of construction and technology. This book covers the production planning process, production balancing activities, and application of industrial engineering concepts in garment engineering. Further, the merchandising activities and garment costing procedures will deal with some practical examples. This book is primarily intended for textile technology and fashion technology students in universities and colleges, researchers, industrialists and academicians, as well as professionals in the apparel and textile industry.

The need for manufacturers to make new products, diversify existing products and remain globally competitive is increasing. Engineering textiles: integrating the design and manufacture of textile products covers many aspects of product development and design conceptualization for both technical and traditional textiles. It also discusses several approaches to the fiber-to-fabric engineering of various textile products. Part one discusses fiber-to-fabric engineering in the context of product development and design of fiber-based products. Part two discusses the different types of fibers, yarns and fabrics suitable for the production of traditional and function-focused textiles. Chapters include key topics such as structure, characteristics and the design of textiles. Part three concludes with a discussion of the development of specific fibre applications, ranging from traditional textile products through to technical textiles such as transport and medical applications. Written by a highly distinguished author, this book is a pioneering guide to textile product design and development for a broad spectrum of readers, ranging from engineers in all fields, including textiles, material, mechanical, electrical, civil, chemical, polymer and fiber engineers. It is also suitable for textile technologists, fiber scientists and for those involved in research and development of both traditional and new-generation textile products. Reviews aspects of product development and design conceptualisation for both technical and traditional textiles Analyses material selection including structure and characteristics of various fibres Examines the development of fibrous products for transportation, medical and protection applications

Electronics in Textiles and Clothing: Design, Products and Applications covers the fundamentals of electronics and their applications in textiles and clothing product development. The book emphasizes the interface between electronics and textile materials, detailing diverse methods and techniques used in industrial practice. It explores ways to integrate textile materials with electronics for communicating/signal transferring applications. It also discusses wearable electronic products for industrial applications based on functional properties and end users in sectors such as defense, medicine, health monitoring, and security. The book details the application of wearable electronics and outlines the textile fibres used for wearable electronics. It includes coverage of different yarn types and fabric production techniques and modifications needed on conventional machines for developing fabrics using specialty yarns. The coverage includes problems faced during the production processes and their

solutions. Novel sensors, specialty yarns, Body Sensor Networks (BSN), and the development of flexible solar tents used for power generation round out the coverage. The book then concludes with discussions of the development of fabric-integrated wearable electronic products for use in mobihealth care systems, smart cloth for ambulatory remote monitoring, electronic jerkin, heating gloves, and pneumatic gloves. Based mainly on the authors' projects and field work, the book takes a practical approach to the issues involved in designing electronic circuits and their possibilities for signals, giving you an understanding of problems that can occur when executing the work. It also describes the future scope of e-textiles using conductive materials for medical, healthcare textile product development, and safety aspects. The text provides guidelines for the development of wearable textiles, giving a new meaning to the term human-machine symbiosis in the context of pervasive/invisible computing.

As consumer demands for specific attributes in their textiles increase and global competition intensifies, it is important that the industry finds ways of engineering certain performance requirements into textiles and apparel. This book reviews how fabrics and garments can be engineered to meet technical performance and other characteristics required for the specific end-use. Chapters begin with fabric and garment handle and making – up performance, followed by wear appearance issues, such as wrinkling, pilling and bagging. Further chapters include fabric and garment drape, durability related issues, as well as physiological and psychological comfort. Key topics of fire retardancy, waterproofing, breathability and ultraviolet protection are also discussed.

Written by two highly distinguished authors, this is an invaluable book for a wide range of readers in the textile and apparel industries, ranging from textile and garment manufacturers, designers, researchers, developers to buyers. Reviews the engineering of fabrics to meet technical performance requirements for specific end-use Chapters examine various wear appearance issues such as wrinkling, bagging and fabric and garment drape Discusses durability related issues including fire retardancy and waterproofing as well as psychological and physiological fabric comfort

Garment Manufacturing Technology provides an insiders' look at this multifaceted process, systematically going from design and production to finishing and quality control. As technological improvements are transforming all aspects of garment manufacturing allowing manufacturers to meet the growing demand for greater productivity and flexibility, the text discusses necessary information on product development, production planning, and material selection. Subsequent chapters covers garment design, including computer-aided design (CAD), advances in spreading, cutting and sewing, and new technologies, including alternative joining techniques and seamless garment construction. Garment finishing, quality control, and care-labelling are also presented and explored. Provides an insiders look at garment manufacturing from design and production to finishing and quality control Discusses necessary information on product development, production planning, and material selection Includes discussions of computer-aided design (CAD), advances in spreading, cutting and sewing, and new technologies, including alternative joining techniques and seamless garment construction Explores garment finishing, quality control, and care labelling

The foremost and the most important step of establishing a business is setting up a factory. While designing of a factory layout has been nowadays handed over to professional architects, the apparel manufacturers must have a basic knowledge of what a 'good' factory layout actually means. A good factory layout offers minimum transportation time and flexibility with no back and forth motion. This series is a one-stop solution for all the factors to be considered, apart from the checklist, and the ways to maximum optimise the factory along with case studies of apparel manufacturing plant layouts in India.

There have been a lot of innovations in making the garment or apparel production sector sustainable. This book highlights sustainable innovations in the apparel production sector, which is the final destination in the textile production segment. Measuring sustainability in clothing is one of the inevitable areas to deal with when it comes to sustainable apparel production, which is also highlighted here.

When thinking about lowering or changing consumption to lower carbon footprints, the obvious offenders come easily to mind: petroleum and petroleum products, paper and plastic, even food. But not clothes. Although the clothing industry is the second largest polluter after agriculture, most consumers do not think of clothes as a source of environmen

Focusing on the importance of the application of statistical techniques, this book covers the design of experiments and stochastic modeling in textile engineering. Textile Engineering: Statistical Techniques, Design of Experiments and Stochastic Modeling focuses on the analysis and interpretation of textile data for improving the quality of textile processes and products using various statistical techniques. FEATURES Explores probability, random variables, probability distribution, estimation, significance test, ANOVA, acceptance sampling, control chart, regression and correlation, design of experiments and stochastic modeling pertaining to textiles Presents step-by-step mathematical derivations Includes MATLAB® codes for solving various numerical problems Consists of case studies, practical examples and homework problems in each chapter This book is aimed at graduate students, researchers and professionals in textile engineering, textile clothing, textile management and industrial engineering. This book is equally useful for learners and practitioners in other science and technological domains.

Cutting-Sewing-Finishing is the common terminology used for the overall process that takes place in any organisation manufacturing garments via the industrial way. The cutting room or cutting department is the place where all the pre-sewing activities like spreading, cutting, bundling, ticketing, fusing, and embroidery are conducted before the cut components are sent to the sewing department. In a garment factory, cutting department is pivotal from the point of view of controlling the material utilisation, considering the fact that material constitutes 60% of the manufacturing cost. Although the labour cost component in spreading and cutting is very less in comparison to sewing, the process involves material conversion which is irreversible, and hence, it is profoundly significant. Like any other department, the technology used and the processes being followed are the two most important parameters of cutting room. This multi-author book is an honest attempt on our part to cover all the cutting room processes in detail to unravel the relevance of material utilisation for garment manufacturing and thus provide an essential guide for cutting room managers and executives. These processes act as the tipping point for a garment factory where even a minor wastage or saving done in the fabric being used can have a major impact on the order margins. Besides, they lay the foundation for the garments' quality and hence become all the more important.

Advances in technology, combined with the ever-evolving needs of the global market, are having a strong impact on the textile and clothing sector. The global textile and clothing industry: Technological advances and future challenges provides an essential review of these changes, and considers their implications for future strategies concerning production and marketing of textile products. Beginning with a review of trends in the global textile industry, the book goes on to consider the impact of environmental regulation on future textile products and processes. Following this, the importance of innovation-driven textile research and development, and the role of strategic technology roadmapping are highlighted. Both the present structure and future adaptation of

higher education courses in textile science are reviewed, before recent advances in textile manufacturing technology, including joining techniques, 3D body scanning and garment design and explored in depth. Finally, The global textile and clothing industry concludes by considering automating textile preforming technology for the mass production of fibre-reinforced polymer (FRP) composites. With its distinguished editor and international team of expert contributors, The global textile and clothing industry: Technological advances and future challenges is an essential guide to key challenges and developments in this industrial sector. Comprehensively examines the implications of technological advancements and the evolving needs of the global market on the textile and clothing industry and considers their role on the future of textile manufacturing The importance of innovation-driven textile research and development and the role of strategic technology roadmapping are thoroughly investigated Recent advances in textile manufacturing technology, including joining techniques, 3D body scanning and garment design and explored in depth Automation in Garment Manufacturing provides systematic and comprehensive insights into this multifaceted process. Chapters cover the role of automation in design and product development, including color matching, fabric inspection, 3D body scanning, computer-aided design and prototyping. Part Two covers automation in garment production, from handling, spreading and cutting, through to finishing and pressing techniques. Final chapters discuss advanced tools for assessing productivity in manufacturing, logistics and supply-chain management. This book is a key resource for all those engaged in textile and apparel development and production, and is also ideal for academics engaged in research on textile science and technology. Delivers theoretical and practical guidance on automated processes that benefit anyone developing or manufacturing textile products Offers a range of perspectives on manufacturing from an international team of authors Provides systematic and comprehensive coverage of the topic, from fabric construction, through product development, to current and potential applications
