Emphasis for the second conference on the history of information science systems was on scientific and technical information systems in the period from the Second World War up through the early 1990s. These proceedings present the papers of historians of science and technology, information scientists, and scientists in other fields on a wide range of topics: informatics in chemistry; biology and medicine; information developments in multinational, industrial, and military settings; biographical studies of pioneering individuals; and the transformation of information systems and formats in the twentieth century.

This book provides an introduction to Human Resource Information Systems (HRIS) for those in the public administration field. organizations. This book describes what an HRIS system is, what the functionality of such a system should be, and outlines the practical aspects of an HRIS. It also compares the different aspects of human resources in public organizations, non-profit organizations, and private corporations, and how differences across organizations may influence the functionality requirements of the HRIS. Finally, the volume contains both an organizational theory component, which frames how an HRIS interacts with an organization both from a functional standpoint and a reporting standpoint. The book includes a practical component, which includes real-world case studies that illustrate the advantages and pitfalls to implementing an HRIS enterprise system. Providing a thorough introduction to HRIS for both academics and practitioners, this volume is appropriate for researchers, graduate students, and practitioners in the fields of public administration, higher education administration, information systems, computer science, and human resources.

As computers are increasingly integrated into the classroom, instructors must address a number of pressing ethical questions regarding online behavior, course design, cyberbullying, and student cyber behavior. Ethical Technology Use, Policy, and Reactions in Educational Settings provides state-of-

the-art research on the impact of ethical computer use in academia and emphasizes the cyberphilosophical aspects of human-computer interactions. It provides significant analysis of the ethical use of educational Internet and computer applications.

Examines practical research and case studies on such benchmark topics as biometric and security technology, protection of digital assets and information, multilevel computer self-efficacy, and end-user Web development. Provides research into the advancement, productivity, and performance of the end user computing domain. Several decades of international aid, predominantly granted by the highly developed world (the haves), for the use of ICT in developing regions (known by several labels, such as the have-nots, bottom of the pyramid, the south, or, some time ago, the third world) have passed, but the holy grail of turning these societies into the ideals defined by the donors is still elusive. Previously the emphasis was on top-down approaches in this endeavour. Now priority is increasingly given to bottom-up approaches, putting the targeted communities first, using methods such as co-creation and living labs. Information and Communication Technologies for Development (ICT4D) is still a domain in search of a common ground. The many different perspectives from

diverse ideologies, paradigms and theoretical perspectives here lead to an interesting debate, but, meanwhile, agents of social change are doing their best to change communities – ostensibly for the better. An ongoing endeavour, this discussion requires further investigation of the complexities of techno-societies. The contributions to this volume range from explorations of theory, models and methods to investigations into the practical implementation of ICT in communities, covering the characteristics of social groups and different generations and gender issues, as well as its applications in education and health. As such, the contributions in this book will inform continuing debates concerning the role of ICT in developing communities on the wrong side of all the technical and social divides in human societies.
