A potentially troubling aspect of modern vehicle design – some would argue - is a trend towards isolating the driver and reducing vehicle feedback, usually in the name of comfort and refinement but increasingly because of automation. There can be little doubt cars have become more civilised over the years yet, despite this, the consequences on driver behaviour remain to a large extent anecdotal. Readers of this book will have heard such anecdotes for themselves. They usually take the form of drivers of a certain age recalling their first cars from the 1970's or 80's, in which "doing 70mph really felt like it". The question is whether such anecdotes actually reflect a bigger, more significant issue that could be better understood? Related questions have been explored in other domains such as aviation, where the change to 'fly-by-wire', for example, did indeed bring about some occasionally serious performance issues which were not anticipated. Despite some clear parallels automotive systems have been left relatively unexamined. The research described in this monograph aims to explore precisely these issues from a Human Factors perspective.

This book highlights the important need for more efficient and environmentally sound combustion technologies that utilise renewable fuels to be continuously developed and adopted. The central theme here is two-fold: internal combustion engines and fuel solutions for combustion systems. Internal combustion engines remain as the main propulsion system used for ground transportation, and the number of successful developments achieved in recent years is as varied as the new design concepts introduced. It is therefore timely that key advances in engine technologies are organised appropriately so that the fundamental processes, applications, insights and identification of future development can be consolidated. In the future and across the developed and emerging markets of the world, the range of fuels used will significantly increase as biofuels, new fossil fuel feedstock and processing methods, as well as variations in fuel standards continue to influence all combustion technologies used now and in coming streams. This presents a challenge requiring better understanding of how the fuel mix influences the combustion processes in various systems. The book allows extremes of the theme to be covered in a simple yet progressive way.

Measurement and testing of engines explained with modern techniques using computers, mathematical modeling and electronic instrumentation. Recent research developments like combustion, flame propagation, engine heat transfer, scavenging and engine emissi.
