By what twist of fate I became the Keeper of a cursed Watch is still beyond my understanding, but it might prove useful, if it doesn't kill me first. Blake I had one mission, and failed it like a moron - take the Watch from point A to point B without getting in trouble. Fair to say trouble found me, and it has the face of a woman with dark hair and lonely eyes. Now, like it or not, we are stuck with each other and my main priority is her safety. But the Fates have a twisted sense of humour, and my presence in her life might do more harm than good. It might kill us all...

The story of an urban-based high achieving Aboriginal woman working to break down stereotypes and build bridges

between black and white Australia. I'm Aboriginal. I'm just not the Aboriginal person a lot of people want or expect me to be. What does it mean to be Aboriginal? Why is Australia so obsessed with notions of identity? Anita Heiss, successful author and passionate campaigner for Aboriginal literacy, was born a member of the Wiradjuri nation of central New South Wales, but was raised in the suburbs of Sydney and educated at the local Catholic school. She is Aboriginal - however, this does not mean she likes to go barefoot and, please, don't ask her to camp in the desert. After years of stereotyping Aboriginal Australians as either settlement dwellers or rioters in Redfern, the Australian media have discovered a new crime to charge them with: being too 'fair-skinned' to be an Australian Aboriginal. Such accusations led to Anita's involvement in one of the most important and sensational Australian legal decisions of the 21st-century when she joined others in charging a newspaper columnist with breaching the Racial Discrimination Act. He was found guilty, and the repercussions continue. In this deeply personal memoir, told in her distinctive, wry style, Anita Heiss gives a first-hand account of her experiences as a woman with an Aboriginal mother and Austrian father, and explains the development of her activist consciousness. Read her story and ask: what does it take for someone to be black enough for you?

The exercises, along with the number of practice problems and group activities available, permit instructors to choose from a wealth of problems, allowing ample opportunity for students to practice what they learn in lecture to hone their skills. In this way, the book perfectly complements any learning platform, whether traditional lecture or distance-learning; its instruction is so reflective of what comes from lecture, that students will feel as comfortable outside of class as they do inside class with their instructor.

This book provides a systematic development of tensor methods in statistics, beginning with the study of multivariate moments and cumulants. The effect on moment arrays and on cumulant arrays of making linear or affine transformations of the variables is studied. Because of their importance in statistical theory, invariant functions of the cumulants are studied in some detail. This is followed by an examination of the effect of making a polynomial transformation of the original variables. The fundamental operation of summing over complementary set partitions is introduced at this stage.

This operation shapes the notation and pervades much of the remainder of the book. The necessary lattice-theory is discussed and suitable tables of complementary set partitions are provided. Subsequent chapters deal with asymptotic approximations based on Edgeworth expansion and saddlepoint expansion. The saddlepoint expansion is introduced via the Legendre transformation of the cumulant generating function, also known as the conjugate function of the cumulant generating function. A recurring theme is that, with suitably chosen notation, multivariate calculations are often simpler and more transparent than the corresponding univariate calculations. The final two chapters deal with likelihood ratio statistics, maximum likelihood estimation and the effect on inferences of conditioning on ancillary or approximately

ancillary statistics. The Bartlett adjustment factor is derived in the general case and simplified for certain types of generalized linear models. Finally, Barndorff-Nielsen's formula for the conditional distribution of the maximum likelihood estimator is derived and discussed. More than 200 Exercises are provided to illustrate the uses of tensor methodology. This is the first textbook on pattern recognition to present the Bayesian viewpoint. The book presents approximate inference algorithms that permit fast approximate answers in situations where exact answers are not feasible. It uses graphical models to describe probability distributions when no other books apply graphical models to machine learning. No previous knowledge of pattern recognition or machine learning concepts is assumed. Familiarity with multivariate calculus and basic linear algebra is required, and some experience in the use of probabilities would be helpful though not essential as the book includes a self-contained introduction to basic probability theory.
